# ANNEX 1

# MEMBER STATE

# PROFILES

The following chapter provides an overview of the Blue Economy in the individual EU27 Member States. It does not include the emerging sectors and focuses purely on the established ones, as this ensures a comparable analysis across all MSs. A brief description specific to each MS is provided, complemented by a table illustrating the evolution of the Blue Economy for the seven established sectors in terms of employment and GVA. This year's edition of the Blue Economy Report supersedes the 2020 Blue Economy Report; in this edition, the 2018 data is final while in the previous edition, it was still provisional and estimated data. Additionally, last year's edition included the UK, and this current report is for the EU27 only. Further information, detailed by sub-sector and activity for the EU and each Member State is provided in Annex 2.

# Belgium

Belgium's established Blue Economy sectors provide around 37 515 jobs and generates almost €4.2 billion in GVA.

The contribution of the established Blue Economy to the Belgium economy is at 1%, remaining stable compared to 2009 and outperformed the national economy: Blue Economy GVA increased by 40.7% while the national economy increased by 32.4% compared to 2009. In terms of jobs, the Blue Economy's share has increased by 0.8%. In absolute terms, Blue Economy jobs increased by 23.1% compared to 2009.

Port activities represent 38% of all Blue Economy jobs and 42.1% of the GVA. In fact, the second busiest (container) port in the EU is located in Belgium: the Port of Antwerp. Marine living resources (20.6%) and Coastal tourism (24.1%) are also important generators of employment while Maritime transport is also a key contributor to GVA (29.3%). Marine renewable energy is a vibrant and growing sector in Belgium.

# Bulgaria

The Bulgarian Blue Economy (established sectors) employs 98 148 people and generates around € 979 million in GVA. The contribution of the Blue Economy to the national economy in terms of jobs is 3.2% and in GVA 2%, a significant decrease compared to 2009 (9% and 4.7% respectively). Overall, Blue Economy GVA decreased by 35.8%, compared to 2009, underperforming compared to the +49.7% of the national economy. In terms of jobs, the Blue Economy's share, at 3.2% in 2018, declined 64.6% compared to 2009.

Coastal tourism is by far the largest contributor to Bulgaria's Blue Economy. In 2018, the sector represented 79.6% of Blue Economy jobs and 68.2% of GVA. Even if already substantial, these are well below the figures reported for the period from 2009 to 2011: at around 90% for jobs and 80% for GVA. The significant drop in 2012, largely extending over the entire period analysed, may in part be due to the terrorist attacks on Israeli tourists at Burgas airport in July 2012, and in part due to the return of the traditionally popular destinations of Turkey, Egypt and Tunisia to the tourist market after the Arab uprising (2010-2012).

Marine living resources and Shipbuilding and repair are also important generators of GVA, at 9.1% and 9.8% respectively, both of which have been growing in recent years.

Bulgaria has a maritime cluster for the sustainable development of the Bulgarian maritime economy through partnerships and joint actions of all stakeholders and members<sup>1</sup>. Members include SMEs, NGOs, educational institutions, and research and development organisations. The association acts towards the creation of favourable conditions for development and enhancement of the competitiveness of the Blue Economy by introducing new organisational, product, market and technological solutions, training, implementation of best practices, as well as for its promotion at a national and an international level. Marine cluster Bulgaria is a full member of the European Network of Maritime Clusters and the Association of Business Clusters in Bulgaria.

# Czechia

Czechia is a landlocked country and the Blue Economy (established sectors) is not a major contributor to its economy as a whole (around 0.3%). However, Blue Economy jobs and GVA have increased in recent years. In absolute terms, the Blue Economy's employment increased by 41.6% between 2009 and 2018, and by 29.2% in terms of GVA. In terms of jobs, the Blue Economy's share has increased 33.7% since 2009.

Port activities is the most significant sector of the Blue Economy, contributing to 57.7% of the employment and 67.9% of the GVA. Shipbuilding and repair follow, representing 19.2% of the jobs and 18% of the GVA.

Czechia has no maritime ports. Hamburg has been one of the region's most important trading partners and a significant transhipment port for Czech and Slovakian foreign trade since the 14<sup>th</sup> century. In 2018, more than 480 000 containers were handled between the Port of Hamburg and Czech container terminals. Apart from goods for the Czech market, transit cargoes are also despatched via Czechia onwards into Slovakia, Austria and Hungary.

Czechia Evolution of the Blue Economy established sectors

# Denmark

The Blue Economy's share in Denmark's national GVA was at its highest in 2011 (6.3%) over the reporting period. It has decreased since and is at slightly over 4.2%. In absolute terms, Denmark's Blue Economy GVA decreased by 0.7% compared to 2009. A different pattern emerges for employment. For the period analysed, the share of employment provided by the Blue Economy has grown by 36.2% compared to 2009 (and by 40.4% in absolute terms) and currently sits at around 4.6%; meaning that over 4% of all Danish jobs derive directly from the Blue Economy.

The Blue Economy (established sectors) employs around 127 201 people and generates over €10.9 billion in GVA. It is dominated by Coastal tourism in terms of jobs, contributing 62% of the total Blue Economy in 2018. In terms of GVA, Maritime transport is the largest contributor (36.2%), followed by Coastal tourism (28.1%) and then Marine non-living resources (15.1%).

Denmark's maritime cluster is referred to as Blue Denmark<sup>2</sup>. Denmark is the world's fifth largest maritime shipping nation<sup>3</sup> – surpassed only by Greece, Singapore, China and Japan. Currently, Danish shipping companies around the world control approximately 2 100 merchant ships. Maersk Line is Denmark's and the world's largest container shipping company, with more than 600 ships. Large Danish shipping companies, such as Norden, DFDS, Clipper, J. Lauritzen and Torm, are also strong players in areas such as product tankers, bulk carriers and service vessels for the offshore industry. The Danish government recently enacted a new bill to amend the rules on ship registration, under which ship owners from third countries are no longer required to satisfy the establishment criterion by primary or secondary establishment. The bill entered into force on 1 January 2018 and aims to increase transparency for ship owners seeking to enter ships into the Danish Ship Register.

<sup>2</sup> Blue Denmark consists of ship owners, shipping companies and a wide range of businesses whose activities emanate from international and Danish shipping. They are, for example, shipbrokers, ports and logistics companies as well as shipyards and industrial and service companies that supply equipment, components and service to ships (<https://www.dma.dk/Presse/temaer/DetBlaaDanmark/Sider/default.aspx>).

<sup>3</sup> Measured by the number of merchant ships operated by country.

# Germany

The German Blue Economy (established sectors) provides about 534 607 jobs and generates around €29.6 billion in GVA. The national GVA has been on the rise over the whole period, increasing 37.4% compared to 2009. However, the same cannot be said of Blue GVA, which showed some variability throughout the same period, with its contribution to national GVA at its lowest in 2014-2016. In absolute terms, Blue GVA increased by 18.5% compared to 2009 while its share towards the national GVA decreased by 13.7%. On the other hand, the Blue Economy's share of employment has remained relatively steady at around 1.3%. In absolute terms, Blue jobs increased 19.1% compared to 2009 values, outperforming the national employment, which increased by 7.5% over the same period; indicating that Blue job's share increased by 10.8%.

According to the data available, Germany's Blue Economy is dominated by Maritime transport, contributing 37.8% to the overall Blue GVA in 2018. In fact, Germany ranked first in terms of GVA for Maritime transport, generating 37% of the EU total in 2018. Port activities (18.8%) and Coastal tourism (18.6%) are also important contributors. In terms of employment, Coastal tourism produced 35.8% of all Blue jobs, followed by Maritime transport (25.9%) and then Port activities (17.33%). Marine living resources has grown the most: +30.1% in jobs and +58.5% in GVA compared to 2009. Germany is split over two sea-basins: the North Sea and the Baltic Sea. The Port of Hamburg is Europe's third busiest port. German ports are important high-tech hubs and also a service provider for the offshore wind power sector. Although data are currently unavailable, Marine renewable energy (offshore wind) is a rapidly growing sector in Germany; the second largest producer in the EU<sup>4</sup>.

<sup>4</sup> According to BWO (the Association of German Offshore Wind Farm Operators represents all organisations that develop, construct and operate wind farms in Germany), the expansion of offshore wind power capacity exceeded that of onshore capacity for the first time in 2019. The industry currently creates a revenue of nearly €9 billion and directly employs 27 000 people, almost half of which work in North Rhine-Westphalia, Baden-Württemberg and Bavaria. The comprehensive value chain (development, construction, operation) creates additional jobs in many businesses.

# Estonia

The Estonian Blue Economy (established sectors) employs over 41 311 people and generates over €1 billion in GVA. The Blue Economy's contribution to the Estonian domestic GVA stands at around 4.4%, a 30.7% drop compared to 2009. In absolute terms, the Blue GVA increased 27.2% compared to 2009. Growth of the overall national economy (in GVA) outperformed the Blue Economy, increasing 83.6% compared to 2009, against 27.2%, respectively. In terms of employment, the Blue Economy share decreased 36.9% compared to 2009, from 10.4% to 6.6%. The Blue economy continues to be dominated by Coastal tourism, which contributed with 68.8% of the jobs and 49.2% to overall Blue GVA in 2018, while Port activities generate 22.3% of the GVA and 8.9% of the jobs.

The European Commission approved under EU state rules, five schemes to support maritime transport. One of the schemes, which encourages ship registration in Europe and contributes to the global competitiveness of the sector without unduly distorting competition, is in Estonia with the introduction of a tonnage tax and seafarer scheme.

There are about 10 000 active seafarers in Estonia, about half of whom sail under the flag of a foreign country. Reducing bureaucracy and simplifying requirements in joining the Estonian register will contribute towards bringing ships back under the Estonian flag and will develop the maritime sector further. The vessels will bring income to Estonia through the collection of registry fees and tonnage tax schemes. This is accompanied by an onshore sector with high growth potential. The companies in the sector will contribute towards creating jobs, which in turn will promote the Estonian economy.

Another important area is passenger shipping, which is directly linked to tourism. The return transport of about 8 million passengers a year in the ca 80 km route between Tallinn and Helsinki is profitable for Estonian companies. During the summer season a ferry or hovercraft departs every hour from Tallinn to Helsinki and back. Although a big part of the income of the transportation section comes from the transfer of goods and passengers, services connected with transportation are also important, especially logistics and warehouses.

## Ireland<sup>5</sup>

11

2021

According to the data, the Irish Blue Economy (established sectors) employs around 69 594 people and generates over €3 billion in GVA. The share of the Blue Economy in the national Irish GVA is relatively low (around 1% over the reporting period), and has overall decreased by 5.4% compared to 2009. In absolute terms, Blue GVA increased by 88.3% while the national GVA increased by 99.2%. For employment, the share of Blue jobs is now at its highest level for the period under analysis (contributing 3.2% to all employment). In absolute terms, Blue jobs increased by 77.4% compared to 2009, against 10.7% for the national employment.

Overall, GVA increased in all the blue sectors apart from the Marine non-living resources and Port activities, which decreased by 29.3% and 6%, respectively. Likewise, total jobs increased, however, the number of jobs decreased in Marine living resources (-12.4%), Marine non-living resources (-6.2%), and maritime transport (-7.9%). Coastal tourism saw a significant increase in jobs, +133.8% compared to 2009. Ireland's Blue Economy is dominated by Coastal tourism, which contributed 79.3% to jobs and 60.1% to GVA in 2018, followed by the Marine living resources (contributing 13.9% to Blue jobs and 19.6% to the GVA).

<sup>5</sup> National reporting by Ireland on its ocean economy differs due to differences in definitions and methodology. (E.g. basic prices instead at factor cost). In addition, due to confidentiality with data, the figures presented differ to national reporting (e.g. Eurostat data does not include data for some sectors such as shipping and oil & gas).

## Greece

The Blue Economy established sectors in Greece employ around 574 102 people and generates over €7.9 billion in GVA. Overall, Blue Economy jobs decreased by 0.4% and GVA by 39.3% compared to 2009. Nonetheless, the share of the Blue Economy to the national economy continues to be substantial: in terms of jobs, the Blue Economy contributes 15.3% of all national jobs, the highest share in the EU. In terms of GVA, Greece ranks fourth with the Blue Economy contributing to 5.0%. Greece's Blue Economy is dominated by Coastal tourism, which contributed with 85.8% to Blue jobs and 66.6% to Blue GVA in 2018. Maritime transport<sup>6</sup> is also a large contributor, with 15.6% of the GVA and 4.1% of the employment, while Marine living resources generates around 6.1% of jobs and GVA.

According to the Union of Greek ship owners<sup>7</sup>, 2016–2017 saw the first signs of improved market conditions for global shipping after a long and deep recession. However, the COVID-19 outbreak has sharply reduced the demand. Greek shipping continues to hold the first position internationally<sup>8</sup>. The Greek fleet represents around 20.7% of total world tonnage and 54% of the total EU fleet. The Greek-flagged merchant fleet ranks eighth internationally and second in the EU (in terms of dwt) after Malta. Moreover, Greek ship owners control 32.6% of the world oil tankers' fleet, 21.7% of the world bulk carriers and 8.9% of the world container vessels<sup>9</sup>. As such, Greek shipping plays an indispensable role in world seaborne trade including the EU's export - import trade and in particular in securing the EU's energy needs through the provision of reliable, efficient, green and safe sea transportation. The contribution of Greek shipping to the country is multifaceted and not limited to the receipts in the Services Balance of Payments from maritime transport services. It ranges from indirect economic investments, to employment opportunities and to raising the profile of the country internationally by being a strategic trade.

# Spain

The Spanish established Blue Economy sectors employ around 928 433 people and generates over €33 billion in GVA. The Blue Economy has had a positive impact on the Spanish economy and employment rates.

In Spain, the share of Blue GVA to the national economy increased by 12.5% compared to 2009, reaching its highest point in 2018 (3%) and growing at a faster pace than the overall national GVA (+22.1% compared to 2009 versus +8.6%). On employment, a similar pattern emerges. The share of Blue Economy jobs to national employment increased by 3.5% compared to 2009. Although national employment increased by 0.9% compared to 2009, Blue Economy jobs grew 4.5% and were at higher levels by 2018 than in 2009.

The Spanish Blue Economy is dominated by Coastal tourism, which contributed 78.6% to blue jobs and 72.3% to GVA in 2018. The Marine living resources sector is also an important contributor, with 12.5% of the Blue jobs and 11% of the GVA. Port activities also contribute with 10.6% to Blue GVA.

In fact, in the EU, Spain ranks first in terms of GVA for Coastal tourism and Marine living resources, generating 30% and 19% of the EU total, respectively.

Shipping, Marine living resources and Coastal tourism continue to be vital contributors to the Spanish national economy. Spain has the fourth-largest economy in the Eurozone, and the country is the second-most popular tourist destination in the world. Spain is split over two sea-basins: the North Atlantic and the Mediterranean Sea and is the largest capture fisheries producer in the EU (in landings weight and value).

Three of the top ten busiest container ports in the EU are in Spain, all located in the Mediterranean: Port of Valencia (5th), Port of Algeciras (7th) and Port of Barcelona (10th) in 2018. The country receives 80% of its imports and sends out over 50% of its exports through seaports, and has the third-largest fishing fleet in the world, meaning that ports play an important role in national prosperity.

# France

The French Blue Economy (established sectors) employs around 369 350 people and generates over €21.7 billion in GVA. Overall, the percentage of the Blue Economy in terms of GVA has decreased compared to 2009 and in fact, was at its lowest during the period 2015–2018 (contributing a meagre 1% share). While in absolute terms Blue GVA has been quite volatile over the period analysed, it increased by almost 18.1% compared to 2009.

The significant GVA increase in Shipbuilding and repair (+107.5%) counterbalanced the 72.3% decrease in Marine non-living resources compared to 2009. In contrast, national GVA in France has increased over the entire period but increased by only two percentage points more than the Blue GVA (+19.5% compared to 2009). As for employment, at a national level it remained rather steady over the period of analysis, increasing only 2.4% compared to 2009, whereas Blue-based employment decreased by 7.9%. This reduction is largely the result of a 35% decrease in the number of jobs in Port activities and 62.7% in Marine living resources.

The Blue Economy in France is dominated by Coastal tourism, which contributed with 53.8% of the Blue jobs and 50.9% of the GVA in 2018. Marine living resources, Port activities and Shipbuilding and repair are also important contributors.

Mainland France is split over two sea-basins: the North Atlantic and the Mediterranean Sea. In addition, France possesses a string of overseas territories in the Caribbean, Indian and South Pacific oceans. Despite the extensive coastlines and abundant islands of Overseas France, the importance of the Blue Economy, although greater than for France as a whole, is still limited: 8 800 firms and 12 500 jobs (depending on the scope used) with significant variations between territories. Most firms are involved in fishing, aquaculture and the processing and marketing sectors: almost 70% in Martinique and French Guiana and up to 89% in French Polynesia. Maritime transport also provides fundamental support to the overseas economies. The cruise industry has enjoyed significant growth in the Pacific overseas departments and collectives since the early 2010s, rebounding in the overseas departments since 2011. The expansion in these sectors is the result of substantial investment in local port infrastructure against a backdrop of strong global growth in the transport of passengers and cargo. Yet, the French overseas territories face fierce regional competition in the sectors of maritime freight, tourism and aquaculture. The fishing and aquaculture industries suffer more specifically from a skills gap<sup>10</sup>.

France has several maritime clusters<sup>11</sup>. The French Maritime Cluster (CMF) was created in 2006 and brings together all the actors of the maritime ecosystem, from industry to maritime services and activities of all kinds. Today, it is made up of more than 430 entities: companies of all sizes, competitiveness clusters, federations and associations, laboratories and research centres, schools and training organisations, local communities and economic players, as well as the French Navy<sup>12</sup>.

# Croatia

15

2021

The Croatian Blue Economy (established sectors) employs 159 378 people and generates around €3.4 billion in GVA.

The Blue Economy contributes 8.2% to the national economy in terms of GVA and 9.8% in terms of jobs. Overall, Blue-based GVA increased 24.5% compared to 2009 due solely to Coastal tourism and Marine living resources. Shipbuilding and repair, Port activities, Marine non-living resources and Maritime transport all saw decreases compared to 2009. Conversely, Blue Economy jobs decreased 11.6% compared to 2009, increasing only in Marine living resources and Maritime transport. Marine non-living resources and Shipbuilding have lost a significant amount of jobs compared to 2009 (83.8% and 41.1%, respectively).

The Blue Economy in Croatia is clearly dominated by Coastal tourism, which contributed with 78% to jobs and 82.2% of GVA in 2018. Marine living resources and Shipbuilding and repair are also important contributors in term of Blue jobs (7.2% and 6.5%, respectively).

Although in decline, the shipbuilding sector continues to be one of the most important industrial sectors in Croatia. The current Croatian shipbuilding industry is almost negligible in the context of global shipbuilding; however, it has a significant role within the national economy. The production portfolio consists of new buildings of various size(s), repair, conversion and offshore constructions. Currently however, several important shipyards are facing severe financial problems and an uncertain future.

# Italy

The Italian Blue Economy (established sectors) employs around 528 659 people and generates over €23.7 billion in GVA. In 2018, it contributed with 2.3% to national jobs and 1.5% to national GVA. The share of Blue GVA underwent a low period between 2011 and 2015 but has returned to 2009 figures. Blue jobs also appear to be recovering, albeit at a slower pace. In absolute terms, Blue jobs have decreased by 13.5% compared to 2009 while GVA has increased by 11.1%, exactly the same increase in national GVA. Apart from Maritime transport and, to lesser extent, Marine living resources, all other sectors have seen significant drops in employment compared to 2009. On the other hand, only Marine non-living resources has seen a substantial decrease in GVA (-60.5%) compare to 2009.

The Blue Economy in Italy is largely dominated by Coastal tourism, which contributed 58.1% to Blue jobs and 44.2% to GVA in 2018. Marine living resources and Maritime transport are also an important contributor to the Blue Economy, generating 14.1% and 13.1% of jobs and 11.2 and 20.1% of GVA, respectively. In fact, all established blue sectors are important contributors to Italy's economy, apart from Marine non-living resources and Marine renewable energy. At the EU level and in terms of GVA generation, Italy ranks second in Maritime transport, producing 16% of the EU total, third in Coastal tourism (13%), Marine non-living resources (19%) and Shipbuilding and repair (19%), fourth in Marine living resources (14%) and Port activities (9%).

Further deterioration in Marine non-living resources is expected as the Italian parliament approved an 18-month moratorium on offshore oil and gas exploration permits, as well as a sharp increase in fees payable on upstream concessions. Even with the large potential for offshore gas deposits in southern Italy, the government intends to prioritise renewable energy developments and move towards decarbonisation instead. The moratorium, which could be extended, gives the government time to agree a new "plan for the sustainable energy transition of suitable areas", designed to define the geographical areas where exploration and production activities are to be allowed in future. The moratorium affects 73 existing exploration permits, of which 26 are offshore, as well as 79 pending applications for exploration permits (including 25 offshore). The 30MW offshore wind project off the port of Taranto, Italy's first offshore wind site and set to be the first in the Mediterranean Sea, is likely to be fully operational by this year<sup>13</sup>. Thus, the contribution of Marine renewable energy to Italy's Blue Economy is expected to increase in the new future.

# Cyprus

The Blue Economy established sectors in Cyprus employ around 39 982 people and generate over €1.1 billion in GVA, representing a 6.1% share of the national economy measured in GVA and 10.3% of the jobs. The Blue Economy's contributions to both national GVA and employment have remained relatively stable throughout the period of analysis (2009-2018). While Blue GVA (in absolute terms) has increased 7.6% compared to 2009, its share has decreased by 3.3%; i.e., the national economy increased more than the Blue Economy.

As an island state, it is not surprising that the Blue Economy in Cyprus is dominated by Coastal tourism, which represents 84.6% of Blue-based jobs and 79.3% of the GVA in 2018. Port activities and Shipbuilding and repair contribute a further 7% in terms of GVA.

The EU Commission, under EU state aid rules, has approved the prolongation of Cyprus's tonnage tax scheme, which applies to ship ownership, ship management and ship chartering activities. Cyprus was the first open registry to have a Tonnage Tax System (TTS) approved by the EU and this system was extended in 2019 for another ten years. The system's prolongation provides stability and certainty for current and future shipping companies flagged or operating in Cyprus. The prolongation is also expected to encourage ship registration in Europe, as well as the presence and growth of shipping companies and maritime operations in the EU. The system contributes to the competitiveness of the EU Maritime transport sector while supporting Europe's high environmental and safety standards.

## Latvia

The Latvian Blue Economy (established sectors) employs around 40 698 people and generates over €653 million in GVA. Overall, Blue GVA increased by 69.7% compared to 2009 and jobs by 22.8%. Jobs increased in the Port activities sector (34.6%), Coastal tourism sector (54.1%), and Maritime transport sector (15.6%) while decreasing in all other Blue Economy sectors analysed.

The share of the Blue Economy towards national GVA increased by 13.5% between 2009 and 2018. The same trend can be observed for employment (23.4%). The percentage of Blue Economy employment in terms overall employment levels increased by 22.8% during the reporting period. Latvia's Blue Economy is dominated by Coastal tourism, which contributed to 62.5% to jobs and 47.6% to Blue GVA in 2018. Port activities is also an important contributor, generating 15% of jobs and 32.7% of GVA.

While no maritime cluster in Latvia is yet defined in any official policy document, the building blocks exist, i.e., sectors according to the European Cluster Observatory<sup>14</sup>. However, links between these maritime sectors and activities are weak. Latvia has three major sea ports and seven smaller ports. Riga is the biggest port in Latvia and second biggest in the Baltic States reaching 32.8 million tonnes in cargo turnover in 2019. The port of Ventspils is one of the leading deep-water ports of the EU on the East coast of the Baltic Sea, servicing the largest vessels entering the Baltic Sea throughout the whole year and with an annual turnover of around 30 million tonnes. Liepaja is the third biggest city in Latvia with old manufacturing traditions. Shipbuilding and repair and Maritime transport are also noticeable sectors but have remained rather stagnant over the period analysed. The development of a Latvian maritime cluster could help foster cooperation and integration between the maritime sectors may help boost the Blue Economy as a whole.

## Lithuania

The Lithuanian Blue Economy (established sectors) employs around 25 099 people and generates over €668 million in GVA. Overall, Blue GVA increased 77.2% compared to 2009 while its share to the national economy increased by 5.8%. In 2018, the Blue GVA contributed 1.6% to the national economy (measured in GVA), same value registered in 2009. In terms of employment, Blue jobs increased by 0.7% in absolute terms (around 181 jobs) compared to 2009, while its share to national employment increased by 2.6%, from 1.9% in 2009 to 1.9% in 2018. That is, national job growth was higher than jobs in the Blue Economy.

The Blue Economy in Lithuania is dominated by the Marine living resources, which accounted for 32.7% of Blue jobs and 29.4% of GVA in 2018. Port activities and Shipbuilding and repair are also large contributors, generating 26% and 21% of GVA, respectively while providing 14.4% and 24.6% of jobs, respectively.

The Lithuanian fishing fleet (Capture fisheries) is composed of a Baltic Sea and distant-water or high-sea fleet, the latter being more important in terms of employment and GVA generated. The aquaculture sector, which is dominated by carp (to a much lesser degree by European eel and sturgeon), produced around 14% of the total primary sector. There are around 95 fish processing firms employing over 4 200 employees, and together with wholesale, generate around 94% of the total GVA generated by the Marine living resources, up from 80% in 2009.

A maritime cluster is concentrated around the Port of Klaipeda, Lithuania's only seaport and an important transport hub. The shipbuilding sector is mainly specialised in the building and repair of smaller and specialised ships, such as fishing boats and vessels used in oil and gas production. The Port of Butinge Marine (oil) Terminal is a small port close to the border with Latvia, which handles crude oil through an SPM<sup>15</sup> system.

# Luxembourg

As a land-locked country with no direct sea access, Luxembourg's Blue Economy (established sectors) employs just 407 persons but generates around €33 million in GVA, mainly due to Maritime transport and, to a lesser extent, Port activities. As is to be expected, the direct contribution of the Blue Economy to the national economy, in GVA and jobs, is minimal (0.1%).

According to Luxembourg Trade & Invest<sup>16</sup>, Luxembourg's venture into the shipping sector is a remarkable success story. Approximately 1 000 jobs in Luxembourg are linked directly or indirectly to the maritime sector. Ship owners established in Luxembourg provide jobs to around 400 highly-skilled employees on shore and around 4 000 at sea; and a further (approx.) 600 maritime related jobs are located in insurance companies, banks, law firms, consultancy groups and maritime logistics operators.

In the 1980s, Luxembourgish authorities created a national shipping register and today, more than 240 vessels with a gross tonnage of around 2 million tonnes fly the Luxembourg flag. Luxembourg is connected to the North Sea by way of rail, rivers and roads to three world-leading ports: Rotterdam, Antwerp and Zeebrugge, all located less than 300 km away from Luxembourg City.

The Luxembourg Maritime Cluster<sup>17</sup> contributes to the development of the maritime sector and maritime related services in Luxembourg through the implementation and promotion of communication strategies both in Luxembourg and abroad. Forty-one firms and organisations currently take part in the project.

# Hungary

As Hungary is a landlocked country, the Blue Economy is not a main contributor to its economy as a whole. In terms of GVA, its share was around 0.6% in 2018, a 49.7% increase since 2009. In absolute terms, Blue GVA increased by 110.9% compared to 2009. The Blue Economy established sectors account for 0.5% of jobs, a 43.6% increase since 2009. It is worth mentioning that Blue Economy jobs have outperformed national levels compared to 2009: Blue Economy jobs grew 70.4% against 18.7% for national employment, as well as in terms of GVA growth, with Blue GVA growing 110.9% against 40.9 % of domestic GVA compared to 2009.

The Blue Economy in Hungary is dominated by Port activities, contributing to 43.1% of the Blue jobs and 34.1% of GVA. Marine living resources and Shipbuilding and repair are also important contributors.

The Port of Hamburg plays a significant part as a transhipment, storage and distribution centre for Hungary's seaborne foreign trade. Hungary is set to invest in a port and logistics base in the Italian city of Trieste. The port will become Hungary's sea exit in the Adriatic for international trade.

Hungary stopped commercial fishing in inland waters in 2016. As a result, the bulk of the domestic fish supply is from aquaculture. In 2017, the sector employed 1 805 person and total aquaculture production was around 1 257 tonnes, an 11-12% increase compared to 2016. Common carp remains the most important cultured species, with 82% of the total food fish production. Fish processing is relatively underdeveloped and many fish producers have on-site fish processing units as a way of adding value to their products and meeting market demand. Most of these do primary processing, such as filleting. There are a limited number of processing plants producing more sophisticated products such as boneless, kitchen-ready products. Several enterprises repackage imported seafood. Foreign trade in fish products has been increasing, however, Hungary mostly exports raw material (live fish), while it imports highly processed value-added products. The export value was €19.4 million in 2017, while the import value was a little over €90 million; i.e., a trade deficit of €70.6 million.

Hungary Evolution of the Blue Economy established sectors

## Malta

The Maltese Blue Economy (established sectors) employs around 25 432 people and generates almost €713 million in GVA. As an island state, it is clearly dominated by Coastal tourism, contributing 87.5% to Blue Economy jobs and 81.4% to GVA in 2018. Marine living resources is also a contributor to Blue jobs (7.9%) and GVA (5.2%).

Although the percentage that the Blue Economy contributes to national GVA grew by 36.2% compared to 2009, the Blue Economy GVA has increased by 177.4%, hitting its highest point in 2018 for the reporting period. In addition, Malta's national GVA rose sharply between 2009 and 2018 by 103.7%. Similar trends are observed in employment where overall, national employment has risen by 48.1% while Blue jobs increased by 59.6% compared to 2009.

## Netherlands<sup>18</sup>

According to the data, the Dutch Blue Economy (established sectors) directly employs around 174 834 people and generates over €11.8 billion in GVA. Although the Dutch Blue GVA has seen a 6.3% increase compared to 2009, its contribution to national GVA was 13.9% lower in 2018. In terms of employment, national employment has remained relatively stable over the reporting period (+3.9% compared to 2009), whereas Blue jobs increased by 31%, peaking in 2018. Furthermore, the number of Blue jobs' share increased by 26.1% when compared to 2009.

Port activities, Maritime transport and Coastal tourism are the main contributors, generating 36.1%, 16.1% and 18.8% of the GVA respectively. Employment is more evenly distributed among the sectors, apart from Marine non-living resources and Marine renewable energy, which provide only 1.1% and 0.4% of the Blue jobs, respectively.

The Netherlands has four major seaports: the ports of Rotterdam, Amsterdam, Zeeland Seaports, and Groningen Seaports. The Port of Rotterdam has a broad range of amenities has almost every port facility imaginable, including cruise, container, general cargo, oil and gas terminals, as well as bulk terminals and a liquefied natural gas (LNG) terminal. It is the busiest seaport in Europe and has a thriving petrochemical industry and several oil refineries. Crude oil arrives by sea to be processed and delivered to areas in the Netherlands, Germany, and Belgium. The port of Amsterdam, Europe's fifth largest port, is another major asset for logistics and distribution operations.

Notes: The total value of the Dutch Blue Economy is underestimated – significant amount of data at Eurostat are unavailable for several sub-sectors and activities

<sup>18</sup> National reporting by Netherlands on its ocean economy differs due to the lack of EUROSTAT data stemming from confidentiality issues.

# Austria

The Austrian Blue Economy (established sectors) employs around 6 510 people and generates almost €452 million in GVA. The Blue Economy in Austria only represents 0.1% of the national GVA, and its share increased by 1.3% compared to 2009. In fact, Blue GVA increased 36% compared to 2009 against 34.3% for the national economy. In terms of employment, the share of Blue jobs stands at 0.2% but has increased 13.4% compared to 2009 against 8.5% for national jobs overall.

The main Blue sectors in Austria are Marine living resources, Port activities and Shipbuilding. Marine living resources produced €171 million in GVA and provided 2 925 jobs in 2018. Port activities produced 1 582 jobs and generated €186 million in GVA. Shipbuilding and repair accounted for a further 1 316 jobs and €84 million in GVA.

Despite being a landlocked country<sup>19</sup>, Austria has established a modest but competitive maritime industry, focusing on high quality aquaculture production and related value-added activities, as well as seaborne shipping and trade with block trains operating to two cargo gateways, one in the north (Port of Hamburg) and another in the Adriatic (Port of Trieste). This covers shipbuilding and repair, yachts and cruise ships, engines, shipyards, environmental and safety systems, and systems for port management and logistics – for a range of seaward and inland waterways uses.

The seafood industry in Austria is limited to freshwater – mainly aquaculture and processing. Currently, about 4 thousand tonnes of freshwater fish, valued at 26.4 million euro, are produced annually, mainly carp (natural ponds) and trout (flow-through systems, raceways). Other important species are char, pike-perch and various catfish. Aquaponics are a growing industry in Austria.

<sup>19</sup> The United Nations Convention of the Law of the Sea (UNCLOS) of 1982 recognises the right of “every state, whether coastal or land-locked to sail ships flying its flag on the high seas”.

# Poland

25

2021

The Polish Blue Economy (established sectors) employs around 145 915 people and generates over €3.1 billion in GVA. It is dominated by Coastal tourism, which contributed 34.2% to Blue jobs and 28.6% to GVA in 2018.

Poland's national GVA growth has been rising by 54.1%, as has Blue Economy GVA, increasing by 38.9% since 2009. At 0.7% in 2018, the share of Blue Economy GVA to national GVA fell 9.8% compared to 2009. While national employment grew by 3.2%, Blue Economy jobs increased 18.2% compared to 2009.

Port activities, Marine living resources and Shipbuilding and repair are also important contributors to the Blue Economy, providing 19.6%, 26.5% and 17% of the jobs and 25.1%, 22.6% and 18.6% of the GVA in 2018, respectively.

The main ports in Poland are Gdańsk, Gdynia, Szczecin and Świnoujście. Gdańsk is a major international transportation hub and Europe's fastest growing port, making plans to double its cargo volumes to 100 million tonnes a year. Gdańsk is ideally situated as a gateway port, connecting Nordic countries to central, eastern and southern Europe.

Poland also has a considerable fish processing and trade sector, one of the largest in Europe. In fact, the activity 'Processing and preserving of fish, crustaceans and molluscs' contributed to 14% of overall Polish Blue GVA in 2018. It plays a major role in supplying the EU with processed fish products such as smoked salmon and trout, canned herring, mackerel, and sprat, and ready-to-eat fish products like salads and fish marinades. Other products include fresh and frozen cod fillets, ready-to-prepare frozen fish fillets, freshwater and diadromous fish such as pike-perch, as well as fresh and frozen whole fish like trout and sprat. In 2017, Poland exported 445 thousand tonnes of fisheries and aquaculture products valued at over €2 billion; 93% of which was exported to other EU countries. Around 54% of production is exported to Germany, with the majority of the remainder destined for the United Kingdom, France, and Denmark.

# Portugal

The Portuguese Blue Economy (established sectors) employs around 258 613 people and generates over €5.8 billion in GVA. Blue Economy GVA increased by 73.5% compared to 2009 while jobs increased by 54.3%. The share of Blue GVA to national GVA also saw a significant increase of 53.1% and the share of Blue jobs by 54.3% compared to 2009. In comparison, the national GVA increased by 13.3% while national employment fell 0.6% on 2009 figures.

The Blue Economy in Portugal is primarily dominated by Coastal tourism, which contributed 82% to Blue jobs and 77% to GVA in 2018. Marine living resources is also an important contributor, providing 13.8% of jobs and 13.2% of GVA in 2018. Port activities bring in 6.3% of the Blue GVA but 1.7% of the jobs.

Portugal has the largest Exclusive Economic Zone (EEZ) in Europe and became the first EU Member state to prepare a Satellite Account for the Sea (see section 8.3).

Building on the BlueInvest Fund experience, the European Investment Fund (EIF) has launched a Blue Economy mandate called Portugal Blue in partnership with *Banco Português de Fomento*, the Portuguese NPI. Portugal Blue is a €50 million equity partnership between the EIF and the NPI to provide financial support to Portuguese start-ups, SMEs, and midcaps at every stage of development active in the area of blue economy. The programme was announced in October 2020 and the EIF is now receiving applications from fund managers.

## Romania

The Romanian Blue Economy (established sectors) employs around 66 470 people and generates over €1 billion in GVA. The national GVA has seen a significant increase in recent years (+62.5% compared to 2009), however the Blue Economy GVA has been more volatile. Increasing by 18.6% compared to 2009. Employment has decreased nationally (-4.8%) and in terms of the Blue Economy (-19.9%). The share of Blue Economy to national jobs and GVA is not very significant, less than 1%, and has decreased over the period analysed (-15.9%).

Shipbuilding and repair and Coastal tourism are the largest contributor, with 33.5% and 34.4% of Blue jobs and 33.4% and 26.8% of GVA.

Romania's shipbuilding industry underwent some strong development in the 1960s, when the country moved from building small vessels to large cargo ships, to later specialising in the construction of vessel hulls that are then outfitted at other shipyards.

## Slovenia

Although a coastal state, Slovenia has a coastline of only 47 km. The Slovenian Blue Economy (established sectors) employs around 8 252 people and generates over €313 million in GVA. The Blue Economy represents 0.8% share of the national economy and 0.9% of employment. In absolute terms, Blue GVA increased by 35.1% while Blue jobs increased by 0.2% compared to 2009. While the national GVA remained relatively stable over the first part of the period analysed, it grew towards the end of the reporting period. In terms of employment, national jobs increased 0.7% compared to 2009.

Slovenia's Blue Economy is dominated by Coastal tourism in terms of employment and Port activities in terms of GVA. Coastal tourism generated 47.4% of the Blue jobs and 32.3% of the GVA, while Port activities, contributed 30% to Blue jobs and 48.7% to GVA.

# Slovakia

As a landlocked country, the Blue Economy is not a main contributor to Slovakian national economy as a whole. However, while national GVA grew steadily throughout the reporting period, overall increasing 38.8% compared to 2009, Blue GVA increased by 425%.

On employment, Blue-based jobs (established sectors) also increased more than national jobs, 81% against 7.5% compared to 2009, respectively. Port activities saw substantial growth for the period, with Blue GVA increasing over 425% and jobs by 81%.

# Finland

The Finnish established Blue Economy sectors employ around 52 222 people and generates over €2.9 billion in GVA.

Finland has seen a fall in how much the Blue Economy contributes to its national GVA: from around 1.6% in 2009 to 1.5% in 2018. Finland's national GVA increased by 27.2% compared to 2009 while Blue GVA increased by only 15.7%. Similarly, the share of Blue jobs to the national employment has also decreased. While national jobs increased by 1.7%, Blue jobs decreased by 4.2% compared to 2009.

The Blue Economy in Finland is dominated by Coastal tourism, which contributed 44.7% to Blue jobs and 33.8% to GVA in 2018. Most employment is also concentrated in Coastal tourism. In fact, it is the only blue sector that saw an increase in employment (+28% compared to 2009). It is also the sector that saw the highest increase in terms of GVA (+56.2% compared to 2009).

# Sweden

31

2021

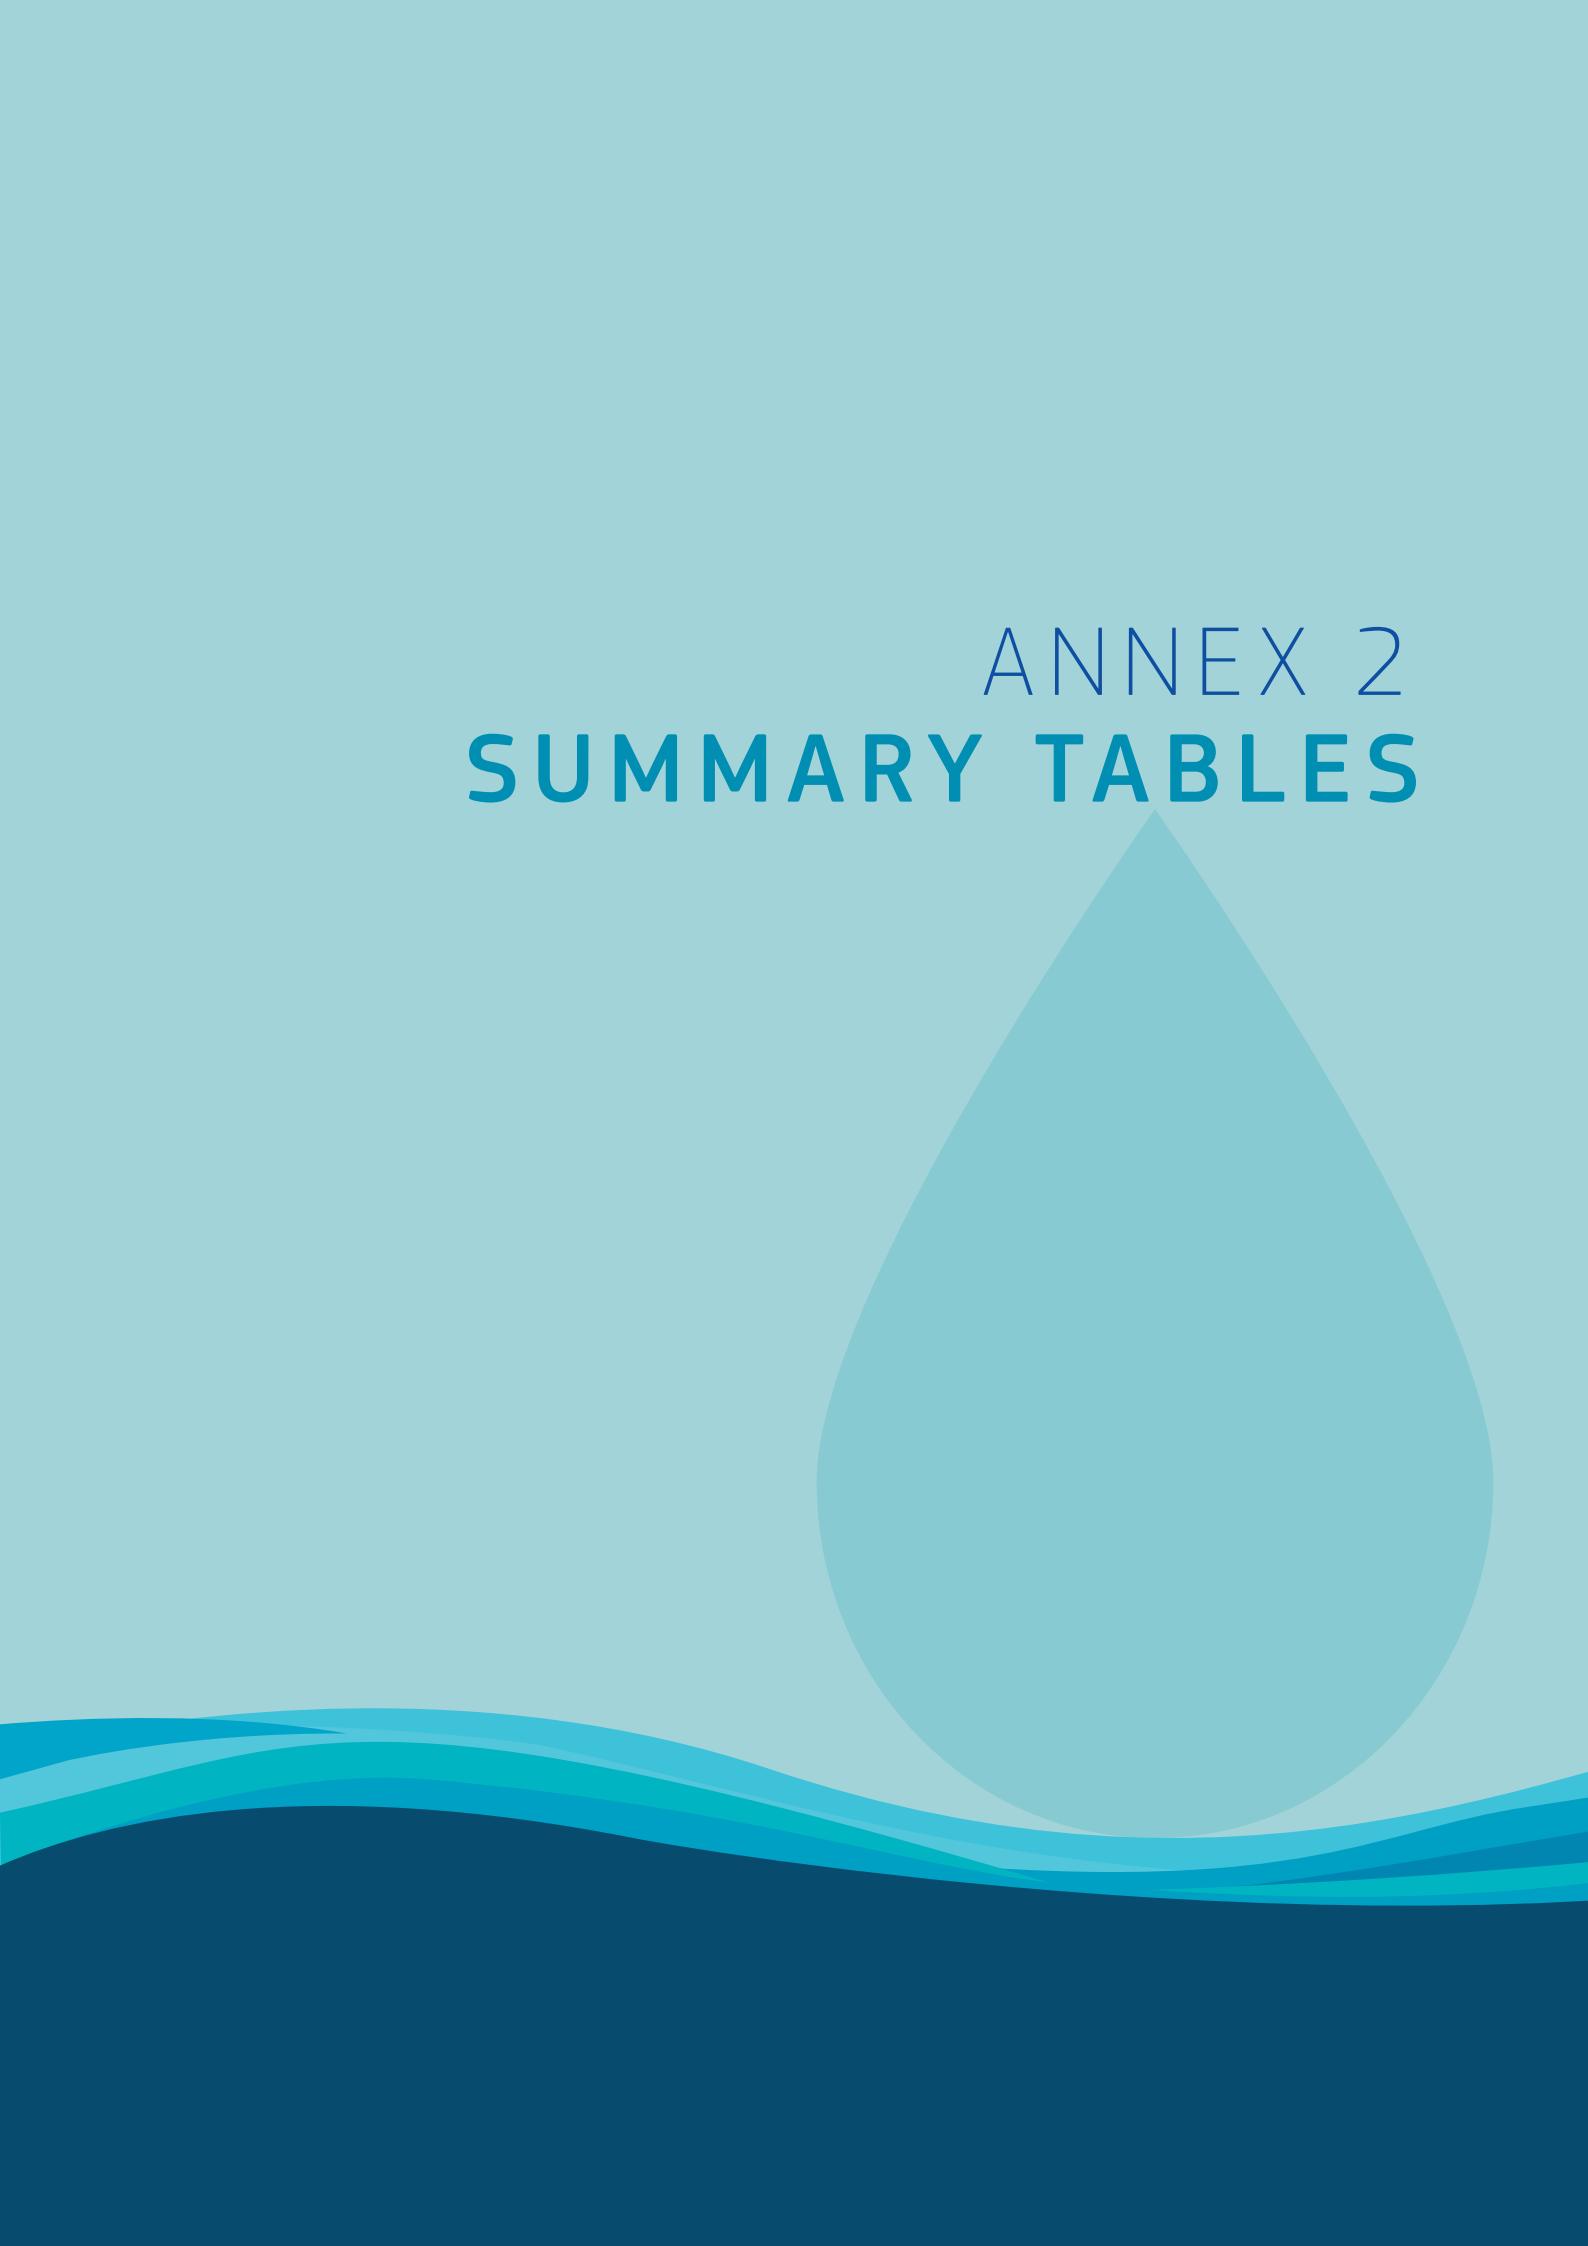

The Swedish established Blue Economy sectors employ around 118 961 people and generates over €6 billion in GVA.

Both Blue GVA and national GVA have substantially increased in Sweden, by 42.7% and 51% compared to 2009, respectively. The share of Blue GVA to national GVA decreased by 5.5% compared to 2009. In terms of employment, national jobs increased by 11.8% compared to 2009, while Blue jobs decreased by 3.2%; translating in a 13.4% decrease in the share of Blue jobs to the overall national employment in Sweden.

The Blue Economy is dominated by Coastal tourism, which contributed 68.4% to Blue jobs and 59.8% to GVA in 2018. Maritime transport is also an important contributor, providing almost 15.1% of the Blue jobs and 21.5% of the GVA. Marine living resources comes in third with 6.7% of the Blue jobs and 7.1% of the GVA.

**Table A33** Sweden: Overview of the Blue Economy by sub-sector and activity

# ANNEX 3

# METHODOLOGICAL FRAMEWORK

# ANNEX 3.1. ESTABLISHED SECTORS

## A3.1.1. DATA SOURCES AND TIMEFRAME

The analysis of the established Blue Economy sectors is based on the standardised data provided by the Structural Business Statistics (SBS) compiled by Eurostat. The SBS were complemented by the EU Data Collection Framework (DCF)<sup>20</sup> for the primary sectors (capture fisheries and aquaculture). Given the time lag in the release of SBS and DCF data, the latest available year is 2018, which is used as the reference year for the current report. However, SBS data for 2018 are provisional and are subject to revision in the next editions. Similarly, the latest fully available data for fisheries and aquaculture in the DCF are for 2017 and 2016, respectively. Data for 2017 (for aquaculture) and 2018 (for both) are “nowcast” estimates. The baseline year is 2009.

For *Coastal tourism*, an ad hoc extraction of data was performed by Eurostat, which was complemented with information from Tourism Satellite Accounts as explained in Section A3.1.6.

For the calculation of the maritime proportions, some specific sources were used as explained in Section A3.1.3. Finally, GDP and its components as published by Eurostat as well as the employment from the Labour Force Survey (LFS) were used for the comparisons of the Blue Economy with the overall economy.

The tables extracted from the Eurostat (and from the DCF) to make the estimations of economic indicators for the established sectors of the EU Blue Economy are summarised in Table A.34.

**Table A.34** Main data sources for the Established Sectors of the EU Blue Economy

Table	Source	Description
DCF_fleet_aquaculture_for_BE	JRC	Fisheries and aquaculture economic statistics.
sbs_na_1a_se_r2	Eurostat	Annual detailed enterprise statistics for services (NACE Rev. 2 H-N and S95).
sbs_na_con_r2	Eurostat	Annual detailed enterprise statistics for construction (NACE Rev. 2, F).
sbs_na_dt_r2	Eurostat	Annual detailed enterprise statistics for trade (NACE Rev. G).
sbs_na_ind_r2	Eurostat	Annual detailed enterprise statistics for industry (NACE Rev. 2 B-E).
inbound_tourism_exp	Eurostat	Expenditure by inbound tourists (from other EU countries) in each Member States. Ad hoc extraction by Eurostat.
TSA Table 1	Eurostat	Inbound tourism expenditure (Tourism Satellite Accounts, in Europe 2019)
TSA Table 2	Eurostat	Domestic tourism expenditure (Tourism Satellite Accounts, in Europe 2019)
tour_occ_ninatc	Eurostat	Nights spent at tourist accommodation establishments by coastal and non-coastal areas.
lfsi_emp_a	Eurostat	Employment and activity by sex and age – annual data.
nama_10_gdp	Eurostat	GDP and main components (output, expenditure and income).
Prodcos (DS-066341)	Eurostat	Sold production, exports and imports by PRODCOM list (NACE Rev. 2) – annual data.

<sup>20</sup> Council Regulation (EC) No 199/2008 of 25 February 2008 concerning the establishment of a Community framework for the collection, management and use of data in the fisheries sector and support for scientific advice regarding the Common Fisheries Policy.

## A3.1.2. SCOPE OF ACTIVITIES

SBS data are based on enterprise data grouped under the declared main activity of each enterprise, according to the *statistical classification of economic activities in the European Community* (NACE Rev.2). Out of the 615 classes of activities singled out through a four-digit NACE code, 46 classes have been identified that have a principal or significant maritime component. They have been classified into sectors and subsectors (Table A.35).

Table A.35 Established Blue Economy sectors: classification

<b>Sector</b>	<b>Subsector</b>	<b>Activity (NACE)</b>		<b>Maritime proportion</b>
		<b>Code</b>	<b>Description</b>	
Marine living resources	Primary sector	A 03.10	Capture fisheries (EU fishing fleet, data from DCF)	100%
		A 03.20	Aquaculture sector (onshore and offshore production, data from DCF)	100%
	Processing of fish products	C 10.20	Processing and preserving of fish, crustaceans and molluscs	100%
		C 10.41	Manufacture of oils and fats	PRODCOM
		C 10.85	Prepared meals and dishes	PRODCOM
	Distribution of fish products	C 10.89	Other food product	PRODCOM
		G 46.38	Wholesale of other food, including fish, crustaceans and molluscs	50%
		G 47.23	Retail sale of fish, crustaceans and molluscs in specialised stores	100%
Marine non-living resources	Oil and gas	B 06.10	Extraction of crude petroleum	Oil production
		B 06.20	Extraction of natural gas	Oil production
		B 09.10	Support activities for petroleum and natural gas extraction	Oil production
	Other minerals	B 08.12	Operation of gravel and sand pits; mining of clays and Kaolin	Aggregates extraction
		B 08.93	Extraction of salt	Salt production
		B 09.90	Support activities for other mining and quarrying	SBS proportions
	Offshore wind energy	D 35.11	Production of electricity	
		D 35.12	Transmission of electricity	
Port activities	Cargo and warehousing	H 52.24	Cargo handling (port services)	50% (or country specific information)
		H 52.10	Warehousing and storage	50 % (or country specific information)
	Port and water projects	H 52.22	Service activities incidental to water transportation	100%
		F 42.91	Construction of water projects.	100%
Shipbuilding and repair	Shipbuilding	C 30.11	Building of ships and floating structures	100%
		C 30.12	Building of pleasure and sporting boats	100%
		C 33.15	Repair and maintenance of ships and boats	100%
	Equipment and machinery	C 13.92	Manufacture of made-up textile articles, except apparel	PRODCOM
		C 13.94	Manufacture of cordage, rope, twine and netting	PRODCOM
		C 26.51	Manufacture of instruments and appliances for measuring, testing and navigation	PRODCOM
		C 28.11	Manufacture of engines and turbines, except motor vehicle, aircraft and cycle propulsion	PRODCOM
		C 25.99	Manufacture of other fabricated metal products n.e.c.	PRODCOM
		C 32.30	Manufacture of sport goods	PRODCOM
Maritime Transport	Passenger transport	H 50.10	Sea and coastal passenger water transport (water transport)	100%
		H 50.30	Inland passenger water transport	100%
	Freight transport	H 50.20	Sea and coastal freight water transport (water transport)	100%
		H 50.40	Inland freight water transport	100%
	Services for transport	N 77.34	Renting and leasing of water transport equipment	100%
		H 52.29	Other transportation support activities	SBS proportions
Coastal tourism	Accommodation	I 55.10	Hotels and similar accommodation	Specific methodology
		I 55.20	Holidays and other short-stay accommodation	
		I 55.30	Camping grounds, recreational vehicle parks and trailer parks	
		I 55.90	Other accommodation	
	Transport	G 47.30	Retail sale of automotive fuel in specialised stores	
		H 49.10	Passenger rail transport, interurban	
		H 49.31	Urban and suburban passenger land transport	
		H 51.10	Passenger air transport	
	Other expenditures	G 47.60	Retail sale of cultural and recreation goods in specialised stores	
		G 47.70	Retail sale of other goods in specialised stores	
		I 56.00	Food and beverage service activities	

Source: Eurostat data Own elaboration.

While certain economic activities can be clearly identified as fully marine (e.g. *Shipping* and *Maritime transport*), for other sectors, the NACE classification includes both land and maritime activities (e.g. cargo handling, warehousing and extraction of oil and gas). In this later case, alternatives sources are used for the estimation of the maritime proportion (see Section A3.1.3).

More than 20 NACE classes have been identified as activities having an important maritime component. However, by the time being, no reliable source is available to estimate their maritime proportion. Therefore, those activities were not included in this year's report (Table A.36).

**Table A.36** Maritime activities for which further information is needed before they can be taken into account

Sector	Activity (NACE)	
	Code	Description
Marine living resources	G 47.11	Retail in non-specialised stores with food, beverages or tobacco predominating
Marine non-living resources	C 19.20	Manufacture of refined petroleum products
	H 49.50	Transport via pipeline
Shipbuilding and repair	E 38.31	Dismantling of wrecks
	G 46.14	Agents involved in the sale of machinery, industrial equipment, ships and aircraft
	C 33.11	Repair of fabricated metal products
	C 25.30	Manufacture of steam generators, except central heating hot water boilers
	C 27.40	Manufacture of electric lighting equipment
Coastal Tourism	N 79.11	Travel agency activities
	N 79.12	Tour operator activities
	N 79.90	Other reservation service and related activities
Marine renewable energy	F 42.22	Construction of utility projects for electricity and telecommunications
	F 43.21	Electrical installation
	J 61.10	Wired telecommunications activities
Water treatment	E 36.00	Water collection, treatment and supply
	E 39.00	Remediation activities and other waste management services
Insurance	K 65.12	Non-life insurance
	K 65.20	Reinsurance
Research and education	M 72.11	Research and experimental development on biotechnology
	M 72.19	Other research and experimental development on natural sciences and engineering
	M 74.90	Other professional, scientific and technical activities n.e.c.

Source: Eurostat data Own elaboration.

Aside from their main activity, enterprises may have one or more secondary activities. Unfortunately, detailed information about the economic importance of secondary activities is unavailable. Therefore, the overall activity for each firm was assigned to its main activity.

### A3.1.3. MARITIME PROPORTIONS

As indicated above, several approaches have been followed to estimate the maritime proportions for those activities which encompass a maritime with a non-maritime component.

For industrial activities (i.e. *Equipment and machinery* and some activities in *Processing of fish products*), the Eurostat statistics on the production of manufactured goods (PRODCOM) were used to estimate the maritime proportion in two steps: 1) specific maritime products were identified within each NACE class; 2) the production value share over the total production of the class was calculated (Table A.37).

Given the high level of disaggregation of PRODCOM data, public available tables contain many confidential data points (e.g. when only one or two companies produce a specific item in a given Member State, those values are not published). In order to avoid the biased generated for confidential data, the proportions were calculated internally by Eurostat and transmitted to DG MARE. In a limited number of cases, the proportions could not be transmitted by Eurostat and, therefore, they were imputed based on the average for the EU.

**Table A.37** PRODCOM items considered maritime within each NACE class

NACE		PRODCOM	
Class	Description	Code	Description
C 10.41	<b>Manufacture of oils and fats</b>		
		10.41.12.00	Fats and oils and their fractions of fish or marine mammals
C 10.85	<b>Prepared meals and dishes</b>		
		10.85.12.00	Prepared meals and dishes based on fish, crustaceans and molluscs
C 10.89	<b>Other food product</b>		
		10.89.14.00	Extracts and juices of meat, fish, crustaceans, molluscs or other aquatic invertebrates
C 13.92	<b>Manufacture of made-up textile articles, except apparel</b>		
		13.92.22.50	Sails
C 13.94	<b>Manufacture of cordage, rope, twine and netting</b>		
		13.94.12.33	Made-up fishing nets from twine, cordage or rope of man-made fibres
		13.94.12.35	Made-up fishing nets from yarn of man-made fibres
C 25.99	<b>Manufacture of other fabricated metal products n.e.c.</b>		
		25.99.26.00	Ships' or boats' propellers and blades therefor
C 26.51	<b>Manufacture of instruments and appliances for measuring, testing and navigation</b>		
		26.51.11.80	Manufacture of instruments and appliances for navigation (including for marine or river navigation)
		26.51.20.80	Radio remote control apparatus (including for ships)
C 28.11	<b>Manufacture of engines and turbines, except motor vehicle, aircraft and cycle propulsion</b>		
		28.11.11.00	Outboard motors for marine propulsion
		28.11.12.00	Spark ignition reciprocating or rotary internal combustion piston engines for marine propulsion (excluding outboard motors) and for other use (excluding aircraft engines and engines for vehicles of CN chapter 87)
		28.11.13.11	Marine propulsion compression-ignition internal combustion piston engines (diesel or semi-diesel) of a power <= 200 kW
		28.11.13.15	Marine propulsion compression-ignition internal combustion piston engines (diesel or semi-diesel) of a power > 200 kW but <= 1 000 kW
		28.11.13.19	Marine propulsion compression-ignition internal combustion piston engines (diesel or semi-diesel) of a power > 1 000 kW
		28.11.22.00	Hydraulic turbines and water wheels
C 32.30	<b>Manufacture of sport goods</b>		
		32.30.13.00	Water-skis, surfboards, sailboards and other water-sport equipment
		32.30.16.00	Fishing rods, other line fishing tackle; articles for hunting or fishing n.e.c.

Source: Eurostat data Own elaboration.

For *Oil and gas*, the production onshore and offshore according to Rystad Energy UCube<sup>21</sup> was used to estimate the maritime proportions.

For *Other minerals*, the following sources were used. For marine Aggregates (B 08.12), the statistics on aggregate production published by the European Aggregates Association ([www.uepg.eu](http://www.uepg.eu)). For *Extraction of salt* (B 08.93), the proportion of solar salt obtained from the European Salt Producers' Association (<https://eusalt.com>). Finally, for *Support activities for other mining and quarrying the maritime* proportion was calculated as the share of maritime B 08.12 (*Aggregates*) and maritime B 08.93 (*Extraction of salt*) over the total of mining activities (B05, B07 and B08). The estimations for *Coastal tourism* were calculated following a specific treatment (See Section A3.1.6).

### A3.1.4. INDICATORS AND VARIABLES

SBS statistics provide a series of variables usually derived from the financial statements of the companies. For the analysis of the established sectors, the following selection of variables and indicators was used: employment (number of persons employed), wages and salaries, turnover, gross value added, gross operating surplus (profit or loss), gross investments and net investments. In addition, the following derived indicators were calculated: average annual wage per persons employed, GVA to turnover, profit margin (gross operating surplus to turnover – gross profit margin), labour productivity (GVA per person employed) and net investment ratio (net investment to GVA). This report focuses on the main variables, further details and breakdowns are available on the online Blue Economy Indicators tool ([https://blueindicators.ec.europa.eu/access-online-dashboard\\_en](https://blueindicators.ec.europa.eu/access-online-dashboard_en)). More details about the indicators and variables are explained in the glossary.

### A3.1.5. DATA IMPUTATION AND ASSUMPTIONS

While the SBS database is quite comprehensive, a few missing points were still detected. To obtain a balance panel, a series of assumptions were made by applying the following rules:

- Imputations are based on other data from the same Member State (i.e. no estimations based on data for other Member States).
- Interpolation or the closest value over the time series of a NACE class (4-digit code) was used to impute missing values.
- When no data were available for a NACE class (4-digit code), the data for the parent NACE group (3-digit code) were evenly distributed among the classes in the group.

### A3.1.6. COASTAL TOURISM

*Coastal tourism* is not a single economic activity but rather a set of activities undertaken by a specific type of consumer (the tourist). *Coastal tourism* happens when a visitor takes a trip to a coastal municipality.<sup>22</sup> It is considered to be part of this category the expenditures in *accommodation, transport and other expenditures* by tourists (for instance, cultural and recreation good, goods in specialised stores and food and beverage services). To calculate the contribution of *Coastal tourism* to the Blue Economy, a specific methodology has been followed.

#### *Expenditure by inbound tourism*

The data for *Coastal tourism* are based on the tourism statistics<sup>23</sup> compiled by Eurostat from the collection by national authorities and, in particular, on the data on the expenditure by visitors on trips. In principle, Member States compile data on outbound trips (e.g. the data for trips from Austria to France and Italy are compiled by the Austrian authorities). Once all Member States have transmitted the micro-data on their outbound trips, Eurostat can calculate the data for inbound trips (e.g. the data for trips to Greece from all Member States). The data refer to the expenditure of those trips with a breakdown for three categories: *accommodation, transport and other expenditure* as well as a breakdown for domestic trips and cross border trips (between EU Member States).

<sup>21</sup> Source: Rystad Energy UCube, version 2018-12-10

<sup>22</sup> Coastal municipalities are those Local Administrative Units (LAU) with a coastline or with 50 % of its territory within 10 km of the sea. The classification of regions has been established by the TERCET Regulation: Regulation (EU) 2017/2391 of the European Parliament and of the Council of 12 December 2017 amending Regulation (EC) No 1059/2003 as regards the territorial typologies. Some ad-hoc corrections on the request of the Member State exist, e.g. certain major cities are treated differently, e.g. Rome and Amsterdam.

<sup>23</sup> For further details, see: <https://ec.europa.eu/eurostat/web/tourism/methodology>.

## *Expenditure by one-day trips*

The data on inbound expenditure mentioned above includes trips with at least one overnight stay in the destination. Therefore, they do not include one-day trips (e.g. to spend one Sunday on the sea side and returning back home). The *Tourism Satellite Accounts* were used for estimating the expenditure by one-day trips, in particular Tables TSA Table 1 and TSA Table 2 on Inbound and domestic tourism expenditure, respectively.<sup>24</sup> The proportion between the expenditure of one-day trips over overnight stays was used to estimate the expenditure of one-day trips for transport and other expenditure (the expenditure in accommodation is obviously zero). For the countries where information was not available, the EU average was considered.

### *Variables: Turnover (expenditure), employment*

The value of expenditure calculated as indicated above is assimilated to the turnover for the three subsectors in *Coast tourism* (i.e. *Accommodation, Transport, Other expenditure*).

The rest of variables (employment, GVA, employee compensation) are estimated from the proportion of each one of them to turnover for the activities indicated in Table A.2.

### *Coastal vs. non-coastal*

Finally, the indicator is further adjusted to take into account the maritime proportion. This is achieved by using data in *tour\_occ\_ninatc* to calculate the fraction of coastal tourism ( $F_{coast}$ ) as the number of nights spent in coastal areas ( $N_{coast}$ ) over total nights ( $N_{tot}$ ):

$$F_{coast} = \frac{N_{coast}}{N_{tot}}$$

$$I_{coast}^i = I^i \cdot F_{coast}$$

Coastal areas, should be understood as the municipalities with a coastline or with at least 50% of their surface area within a distance of 10 km from the coastline. The classification of regions has been established by the TERCET Regulation: Regulation (EU) 2017/2391 of the European Parliament and of the Council of 12 December 2017 amending Regulation (EC) No 1059/2003 as regards the territorial typologies.

## ANNEX 3.2. REGIONAL ANALYSIS

### Objective

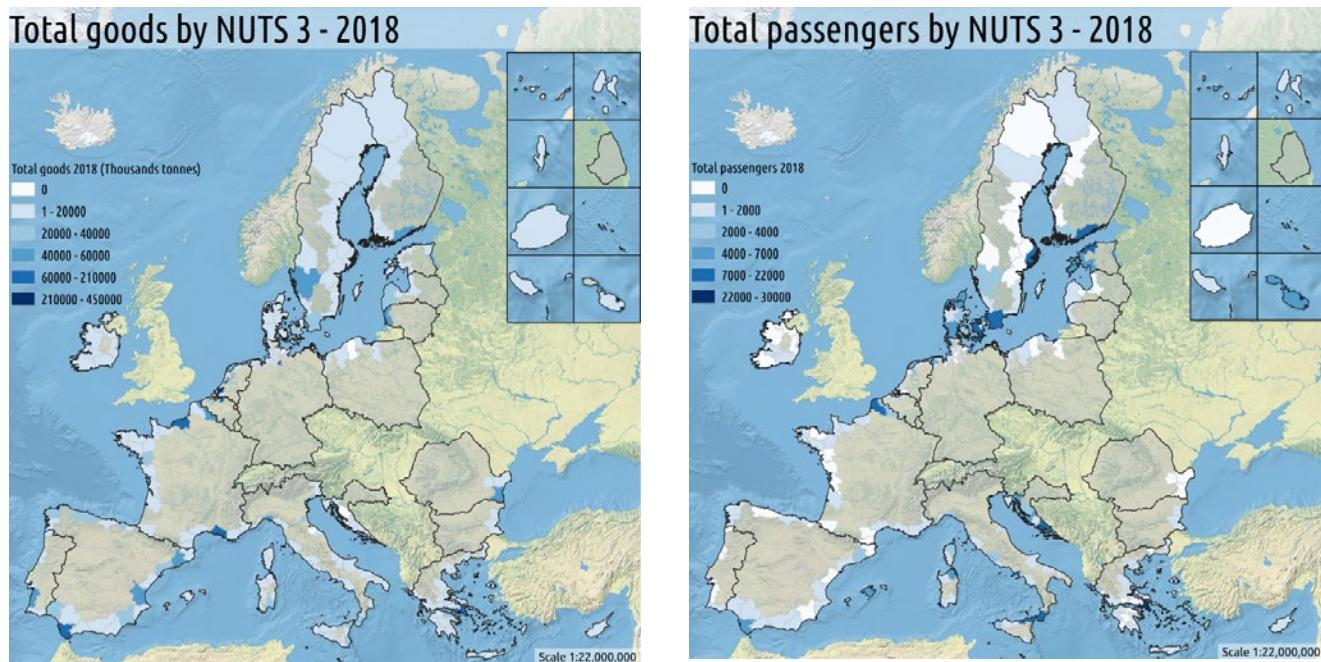

The aim of the regional analysis is to provide an estimation of the size of the Blue Economy and the seven established sectors, in terms of GVA and employment, for the various sea basin of EU waters. The goal is to provide an indication of the relative size of each sea basin and of their specialisation in terms of activities. Improvements in the methodology may be implemented in the coming edition to obtain more accurate estimates.

### Background

In order to provide information regarding the Blue Economy at the coastal community, NUTS2 and NUTS3 level, there is a need for detailed data and analyses. However, collecting and disaggregating data as well as linking them to the respective sea basins proves to be an arbitrary exercise due to the nature of some Blue Economy activities. While **marine-based** activities take place in the sea / by the sea, this does not hold true for **marine-related** activities: these can be undertaken hundreds or even thousands of kilometres from where the marine products originated (e.g. seafood processing and distribution) or from where they are going to be used (e.g. building an engine for a vessel).

This implies that often marine-based activities are easier to allocate to specific marine or coastal locations or sea basins than for marine-related activities. Taking the example of allocating seafood consumption to a certain sea basin proves difficult considering that seafood consumption can take place in inland areas such as Paris or Madrid. For most marine-based activities and some marine-related activities - such as aquaculture, offshore wind energy, desalination, shipbuilding and *Coastal tourism* - we can map where the activity takes place and so which coastal area benefits from it. For some other activities such as *Maritime transport* and capture fisheries we can link the economic activity to the inbound and outbound ports, and from the port to the NUTS2 and NUTS3 (see Figure A.3)<sup>25</sup>.

**Figure A.3 A)** Total goods inbound and outbound by NUTS3. **B)** Total passengers inbound and outbound by NUTS3, 2018

Source: Own elaboration from Eurostat data

A similar analysis has been performed for *Coastal tourism* in section 4.7.5, with a comparable map in Figure 4.36. Hence, collecting data at such disaggregated levels provides a more informative view than just national totals, and should constitute a basis for policy-makers. It also helps to allocate sectors between sea basins for those countries that have activities in more than one sea basin. For other sectors, the link with the coastal area is not necessarily obvious (e.g. seafood processing and distribution). The split between sea basins follows the criteria of Member State participation in respective EU strategies used in prior editions (i.e. assigning the Blue economic activities to the sea basin proportionally to the average of employment and GDP in those sea basins). Additionally, a detailed breakdown of the sectors can be found in Chapter 1.

## Calculations

The size of the Blue Economy (and for each sector) in each sea basin is calculated as the sum of the Blue Economy of the Member States with a façade to the given sea basin according to the following formulas [1] for GVA and [2] for employment:

$$[1] \quad \text{Sea basin}_i^{\text{GVA}} = \sum MS_j^{\text{GVA}} \cdot MS_j^{\text{Share}}$$

$$[2] \quad \text{Sea basin}_i^{\text{Employment}} = \sum MS_j^{\text{Employment}} \cdot MS_j^{\text{Share}}$$

Where:

$i$  are the different sea basins: Atlantic, North Sea, etc.

$j$  are the Member States (Spain, France, etc.).

$\text{share}$  are the proportions assigned to the sea basin according to equation [5].

The Blue Economy of some Members States can be assigned totally to a specific sea basin (e.g. Finland to the Baltic). In these cases, the  $\text{share}$  value is 100%.

In other cases, Member States have several façades (e.g. Spain has the Atlantic façade and the Mediterranean façade). In these cases, the  $\text{share}$  is calculated as the proportion of the NUTS 3 regions in the sea basin with respect to all the coastal NUTS 3 regions in terms for GDP and employment according to formulas [3] to [5].

$$[3] \quad Share_{i,j}^{\text{GVA}} = \frac{\sum \text{NUTS 3}_{i,j}^{\text{GDP}}}{\sum \text{NUTS 3}_{\text{Coastal},j}^{\text{GDP}}}$$

$$[4] \quad Share_{i,j}^{\text{Employment}} = \frac{\sum \text{NUTS 3}_{i,j}^{\text{Employment}}}{\sum \text{NUTS 3}_{\text{Coastal},j}^{\text{Employment}}}$$

$$[5] \quad Share_{i,j} = \text{Average} (Share_{i,j}^{\text{GVA}}, Share_{i,j}^{\text{Employment}})$$

Where:

$i$  are the different sea basins: Atlantic, North Sea, etc.

$j$  are the Member States (Spain, France, etc.).

Data for Employment and GDP were provided by Eurostat. Specific proportions were calculated for each year in the time series (2009 – 2017). For missing data, the most recent available year was used to fill in the gap. In any case, no significant variations in the proportions are observed over time.

For instance, in 2016 in Italy, total employment of the NUTS 3 regions participating in the Adriatic – Ionian strategy amounted to 7.3 million people, while all NUTS 3 coastal regions had a total employment of 13.7 million; that is 53.4% of employees. Similarly, the GDP of NUTS 3 regions in the Adriatic Ionian amounted to €450 billion while the GDP of all NUTS 3 coastal regions in Italy amounted to €860 billion; that is 51.9%. The average of both values, i.e. 52.6%, was used to estimate how much of the employment and GVA from the Italian Blue Economy is generated in the regions participating in the Adriatic – Ionian strategy.

Given the goal of obtaining the size of the Blue Economy in each sea basin, only aggregated data per sea basin are published and not data for Member States, which are considered intermediate calculations.

# ANNEX 3.3. CHAPTER 6 ECOSYSTEM SERVICES, ECONOMY AND THE ENVIRONMENT

6.5 SUPPLEMENTARY MATERIAL for: QUANTIFICATION OF ECONOMIC LOSS OF COASTAL ECOSYSTEM SERVICES FROM SEA LEVEL RISE

## DETAILED RESULTS

### *Impacts at EU level*

The coastal zone in the study area, excluding intertidal flats and open sea, covered approximately 386,000 km<sup>2</sup> of mostly agricultural areas (44%) as well as forests and semi-natural areas (39%). Between 2000 and 2018, the area covered by agricultural declined, with a corresponding expansion of artificial surfaces. A marginal increase in major groups of natural habitats was recorded (forests, wetlands and water). The overall area increased narrowly between 2000 and 2018 (by 183 km<sup>2</sup>). The largest share of sea-to-land transitions were observed for sea harbours. Altogether, the annual ecosystem service of the coastal zone in 2018 was 360 billion euros (Table 1), or almost 3% of the combined GDP of the EU27. Between 2000 and 2012, the value of ecosystem services due to land-use transitions and coastal dynamics narrowly increased by 182 million euro, but they declined by 319 million euros between 2012 and 2018. The majority of the decline was caused by contraction of coniferous forests and intense agriculture, which was partially compensated for by the expansion of wetlands, mainly salt marshes.

Projections of future erosion indicate major losses. By 2050, approximately 2000–2300 km<sup>2</sup> of coastal ecosystems would be destroyed by erosion, depending on the scenario (moderate or high emissions). The more valuable habitats would be more strongly affected. Consequently, the share of the 2018 value of ecosystem services lost would be 4 times higher than the share of land lost. Forests and semi-natural areas would be most affected in terms of area (52–53% of total area lost), but loss of highly valuable wetlands would be the main driver of the decline in ecosystem service (75% of services lost).

In the second half of the 21<sup>st</sup> century, the two emission scenarios diverge. Under moderate emissions, erosion reaches 3800 km<sup>2</sup> by 2100, while emissions under RCP8.5 could lead to destruction of 5000 km<sup>2</sup> of habitats. That is, 1% of the 2018 area under moderate emissions and 1.3% under high emissions scenario. The decline in services would be even greater: 4.3% under moderate emissions and 5.4% under high emissions scenarios (Figure 1). In absolute terms, this is a possible loss of up to 32 billion euros per year (in the upper uncertainty range of high emissions scenario). Around half of the eroded area would be in forests and semi-natural areas (49–50%), but the services of wetlands would make up more than 74% of losses, up to 24 billion euros, or almost a quarter of the 2018 value (Table 2).

The most severely affected type of land cover in absolute terms would be coniferous forests or beaches, sands, and dunes, depending on the scenario. However, beaches, sands, and dunes would be by far the endangered in relative terms. 17–19% is at risk by 2050 and 29–35% by 2100. This translates into second-highest loss in annual services, up to 3 billion euros out of 5.9 billion generated in 2018. Relative losses to salt marshes are second-highest in that category (13–16% by 2100) but also by far the biggest in absolute terms, namely 11–13 billion euro per annum by 2100. Salines, estuaries, inland marshes, and natural grasslands would also be among the most affected in both relative and absolute terms. Agricultural areas associated with an intense mode of production (vineyards, plantations, orchards, permanently irrigated crops, etc.) would be the least affected.

The impacts of coastal erosion also varied between different ecosystem services. As shown in Table 3, the main benefits of the ecosystems are regulating and provisioning services. However, regulating services would be far more affected, losing 7–9% by 2100, compared to a loss of only about 1% for provisioning. Habitat and cultural services are similarly valued at present, but losses of the former are twice as high as those of the latter. On a more detailed level, the most valuable service of the coastal ecosystem is that of waste treatment (91 billion euro). It is provided mostly by wetlands; hence, it would be the second-most affected in relative terms (11–13% by 2100). The highest relative losses would be caused by disturbance moderation (13–15% by 2100), which is also primarily done by wetlands. In contrast, very limited loss (1% or less) would happen to services of climate regulation, soil formation, pollination, genetic resources, or food production.

### *Impacts at member state level*

The scope and importance of coastal ecosystem services varied substantially between countries (Table 4). France had the highest total in 2018, with more than 54 billion euros of annual service, followed by Italy (50 billion euros). However, this only constitutes 2.5–2.8% of national GDP in those countries, similar to the pan-European average. In contrast, services of the third-ranked Greece, totalling 41 billion euros, accounted for more than 18% of GDP. Greece's coastal zone is only narrowly smaller than Italy's (both are approximately 50,000 km<sup>2</sup>), but Greece is a much smaller economy. Other countries for which coastal ecosystem services were highly important include Cyprus, Denmark, Estonia, Croatia and Finland. On the other end of the scale, services in Poland and Germany did not exceed 1% of GDP despite long coastlines. Lower importance was only recorded in countries with very short coastlines, namely Belgium and Slovenia.

Impacts of coastal erosion were similarly unevenly distributed (Figure 2). Denmark was projected to lose most services relative to GDP in all scenarios, reaching 1.2–1.6% by 2100. Greece was the second-most affected country by both the middle and end of the century. Losses of more than 0.3% of GDP per annum are also likely in Estonia and Finland, and possible (within 90% confidence interval) in Latvia and Sweden. On the other hand, in Belgium, Poland, and Malta, the impacts would be almost negligible (less than 0.02% of GDP). In addition, the highest absolute losses would occur in France (18–25% share in Europe depending on the scenario, including the uncertainty range), before Denmark (16–19%), and Germany (11–22%) and Greece (10–18%).

Further, analysing the loss as a percentage of 2018 services yielded a different picture. While Denmark again came on top, with projected losses of 9–12% by 2100, it was followed closely by Germany. The Netherlands was also projected to lose a considerable share of its relatively small amount of services (8–9%) by the end of the 21<sup>st</sup> century. France and Finland could all lose more than 10% of their 2018 services under certain scenarios. Conversely, Belgium, Cyprus, and Lithuania would most likely lose no more than 1%.

### *Impacts at regional level*

The coastal zone in the study area intersects with 328 NUTS 3 regions, of which 282 would be affected by coastal erosion in at least one scenario. The remaining 46 regions mostly did not have direct access to the coastline. The uncertainty in local impacts was large, as can be seen in Figure 3, which presents the minimum and maximum estimates for the year 2100. In the best case, 6 NUTS 3 regions would lose ecosystem services equal to more than 5% of their regional GDP, while 285 regions would lose services worth less than 1% of regional GDP. However, in the worst case, the numbers would be 29 and 240, respectively. Similarly, only 18 regions would lose more than 10% of 2018 services in the best-case scenario but 63 would in the worst-case scenario.

Worst-affected regions are concentrated particularly along the south-eastern coast of the North Sea, Bay of Biscay, and eastern Mediterranean Sea. The ranking of regions varied substantially depending on the method of measuring ecosystem loss (absolute or relative). In absolute terms, the Danish, German, and French regions most frequently appeared on top. The Danish region of North Jutland (Nordjylland -- DK050) and German district of Nordfriesland (DEF07) could lose about 2 billion euros of services. The latter region could incur the highest relative loss in economic terms (40% of GDP in the most extreme case). Many Greek regions were projected to be among the most affected in relative economic terms. Losses relative to 2018 services would be particularly large in several districts of Lower Saxony in Germany, especially Friesland (DE94A) in the range of 59–65% by 2100. Many regions in various parts of France would also be among those with the highest relative impacts, together with some Dutch and Greek regions. In the latter country, Imathia (EL521) could suffer the highest loss among European regions of 65% (under the worst-case scenario). Conversely, the majority of the coasts of the western Mediterranean Sea would be only lightly affected, similar to most parts of the Adriatic Sea, Tyrrhenian Sea, southern Baltic Sea, and Black Sea, as those are relatively sheltered basins with lower storm intensity than the Atlantic Ocean coasts...

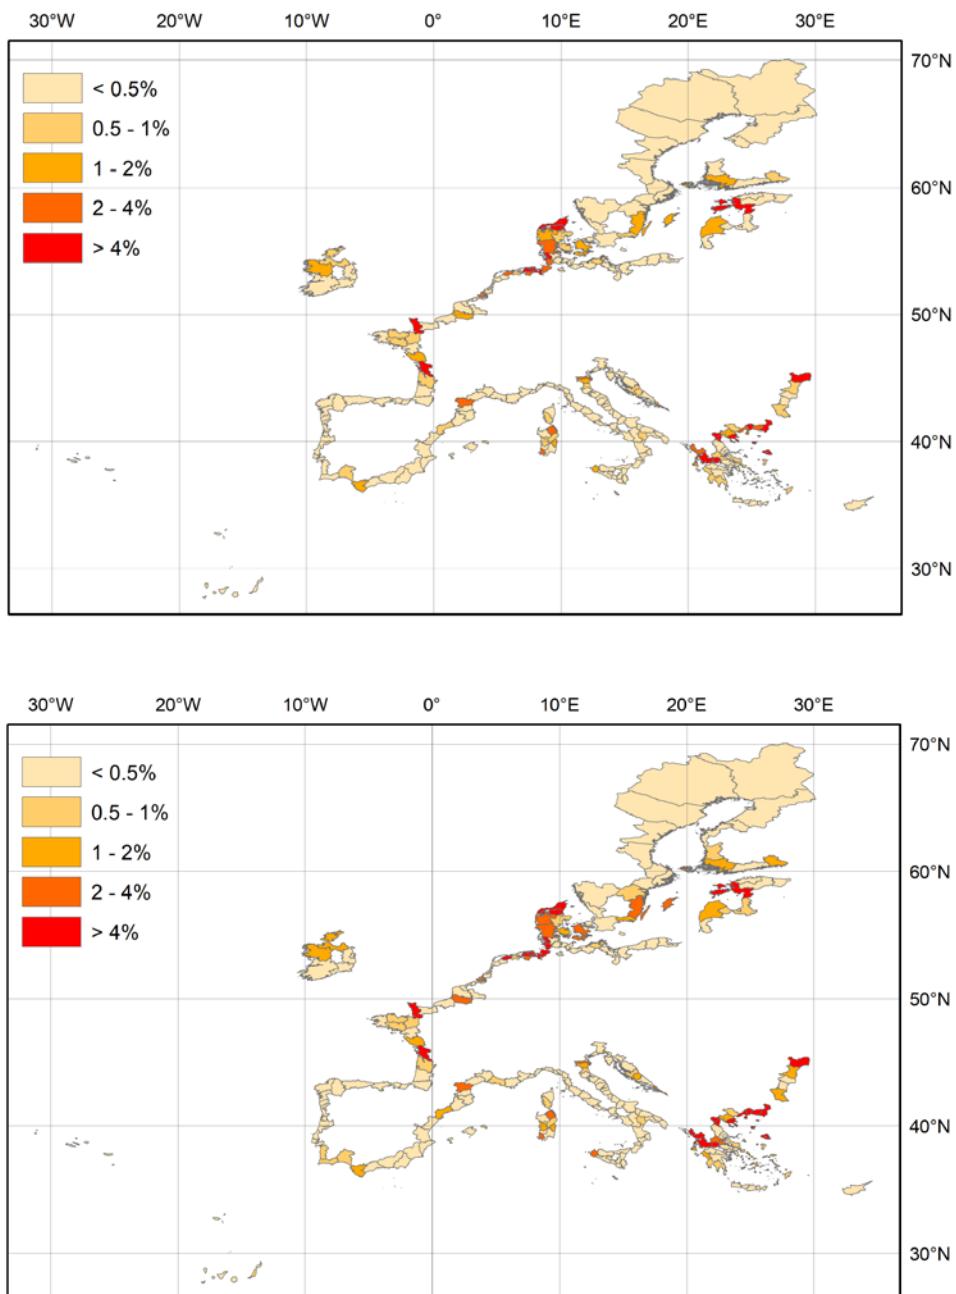

**Figure 1.** Historical (2000–2018) and projected (2050 and 2100) coastal ecosystem services per year, in billions of 2018 euros, total for the study area.

**Figure 2.** Projected (2050 and 2100) loss of coastal ecosystem services per year, % of 2018 GDP, by country and emission scenario.

**Figure 3.** Loss of ecosystem services until 2018 as % of regional GDP by NUTS 3 regions, under moderate (upper panel) and high emissions (lower panel).

## DETAILED METHODS

The study analysed 27 countries of the European Union. The methodology combines multiple datasets to obtain projections of ecosystem service loss. The analysis concentrated on projected impacts for years 2050 and 2100, including the uncertainty of the extent of coastal erosion under two future emission scenarios (RCP - Representative Concentration Pathways): RCP4.5 (moderate emissions) and RCP8.5 (high emissions)<sup>1</sup>.

### *Land cover*

The basis for computing losses to ecosystem services under coastal erosion comprised detailed land cover and use data. Here, we used Corine Land Cover (CLC) data, which is a European database containing information on the physical and biological cover of the earth's surface, including artificial surfaces, agricultural areas, forests, (semi-)natural areas, wetlands, and water bodies<sup>2</sup>. The information provided by the CLC dataset is generally based on computer-assisted photo-interpretation of satellite images according to a standardised and hierarchical nomenclature distinguishing 44 land cover classes. In this analysis, CLC 2018 is used as the baseline land cover/use for future projections. This version of CLC was based on input satellite images with a spatial resolution of 10 m. The minimum mapping unit of CLC is 25 ha, whereas linear features require a width of at least 100 m to be mapped. The CLC dataset is complemented by CLC-Changes, which shows more detailed changes in land cover between reference years thanks to a smaller minimum mapping unit (5 ha). Due to the higher resolution of CLC-Changes and inclusion of only genuine changes, we used this dataset to identify historical changes during 2000–2006, 2006–2012, and 2012–2018. All CLC data were used in vector format in the latest version available at the time of analysis (v20 dated May 1, 2019).

### *Coastal erosion*

Recent probabilistic projections of sandy shoreline dynamics during the 21<sup>st</sup> century<sup>3</sup> combined the range of projected SLR, spatial variations of active beach profile slope, ambient shoreline change trends, and future changes in meteorological drivers such as storm surges and waves. The long-term shoreline change is the sum of shoreline response to the SLR and the ambient shoreline change. The ambient change can be the result of different drivers, for example, geological and hydrodynamic factors or human intervention. It is obtained by probabilistically extrapolating historical shoreline change trends from two datasets based on remote sensing<sup>4,5</sup>. These historical trends were derived from the automated analysis of Landsat images taken from 1984 to 2015 that allowed for the detection of surface-water presence along coastal transects.

The SLR-driven retreat was estimated using a modified Bruun rule<sup>6</sup> and considering recent projections of future sea levels under highRCP4.5 and RCP8.5 emission scenarios<sup>7</sup>. The Bruun rule requires the active beach slope as input, which is estimated considering the closure depth as offshore. Here, the closure depth was estimated considering wave height projections from a 6-member ensemble<sup>8</sup>, resulting in an equal number of estimates. Then, the slope of the active beach profile<sup>9</sup> was estimated by combining topography from the MERIT digital elevation model with bathymetric data from the GEBCO dataset. In addition, an empirical correction factor was applied. This factor was obtained from several local studies that compared the results of the Bruun rule against more elaborate methodologies. Information about the location of sandy beaches along the global coastline was available from a recently published study<sup>5</sup>.

### *Ecosystem service valuation*

The annual value of ecosystem services per hectare of different land cover types was obtained from a global database created by integrating evidence from hundreds of case studies from different parts of the world and adjusting them to a single monetary benchmark<sup>10,11</sup>. The main types of services considered are (1) provisioning services (e.g., food, water, raw materials, and genetic resources), (2) regulating services (e.g., regulation of water and air quality, waste treatment, erosion prevention), (3) habitat services (nursery service, genetic diversity), and (4) cultural services (e.g., recreation and aesthetics)<sup>10</sup>.

In total, estimates for 17 land cover/use classes were available. They were adapted to CLC classes similarly to a previous study<sup>12</sup>. Importantly, zero value was assigned to CLC class *sea and ocean*, as the focus of the analysis is on the ecosystem services lost in coastal erosion without considering that some losses could be offset by services of the open ocean. Nonetheless, these services are estimated to be much lower than those of provided by terrestrial or coastal ecosystem. Further, the ecosystem value data were converted from the purchasing power of the US dollar in the United States in 2007 to euros according to their purchasing power in the European Union (28 countries before the departure of the United Kingdom) in 2018. US dollars were converted to euros firstly using purchasing power parity for actual individual consumption in 2007 and then adjusted the result to the 2018 price level using the deflator for gross domestic product (GDP)<sup>13</sup>. The final valuation of services per CLC class is shown in Table 6. Apart from the total value of all services, the value of each type of ecosystem service was also calculated for a more detailed analysis of the impact of coastal erosion.

**Table 6.** Value of coastal ecosystem services by CLC land cover/use class used in this analysis.

CLC classification				Value per ha (euro)
Level 1	Level 2	Level 3	Codes	
Artificial surfaces	Urban fabric	All categories	111, 112	8971
	Artificial, non-agricultural vegetated areas	All categories	141, 142	8971
	All other categories	All categories	121–133	0
Agricultural areas	Arable land	All categories	211–213	7497
	Permanent crops	All categories	221–223	7497
	Pastures	Pastures	231	5611
	Heterogeneous agricultural areas	All categories	241–243	7497
Forest and semi natural areas	Forests	All categories	311–313	4225
	Scrub and/or herbaceous vegetation associations	Natural grasslands; moors and heathland; sclerophyllous vegetation	321–323	5611
		Transitional woodland-shrub	324	2139
		Beaches, dunes, sands	331	34,586
	Open spaces with little or no vegetation	Bare rocks; burnt areas	332, 334	0
		Sparsely vegetated areas	333	5611
Wetlands	Inland wetlands	Inland marshes	411	34,586
		Peat bogs	412	0
	Maritime wetlands	Salt marshes; salines	421, 422	261,062
		Intertidal flats	423	0
Water bodies	Inland waters	All categories	511, 512	16,851
	Marine waters	Coastal lagoons; estuaries	521, 522	38,943
		Sea and ocean	523	0

#### *Spatial and statistical analysis*

The base coastline was extracted from CLC 2018 (in vector format) by taking the line adjacent to CLC classes *sea and ocean*, *coastal lagoons*, *estuaries*, or *intertidal flats* and any other class than the aforementioned four. Then, a 10 km buffer was generated around the coastline, forming the ‘‘coastal zone’’ that is of interest for this study. To analyse the distribution of services by countries and regions, the coastal zone buffer was further intersected with a vector layer of NUTS 3 regions (2016 version). Eurostat’s NUTS layer reproduces the coastline in less detail than the CLC layers and inconsistently omits certain areas on the interface of land and sea. Therefore, it was adjusted the layer by “extrapolating” the NUTS regions to the full extent of our coastal zone buffer using a nearest-neighbour analysis. The historical development of ecosystem services was calculated by intersecting four CLC layers (2000, 2006, 2012, 2018) and three CLC-Changes layers (2000–2006, 2006–2012, 2012–2018) with the coastal zone layer. The values from Table 6 were then multiplied by the area of CLC patches belonging to a particular NUTS region.

Coastal erosion projections were obtained in the form of a point layer with varying distances between the points, which represent the beach transects used in the original study<sup>2</sup>. The erosion values were assigned to CLC coastline segments according to the nearest-neighbour approach but only within a radius of 10 km. The coastline segments were split into much smaller fragments (50 m on average) at each vertex to allow the assignment of erosion data to the coastline would be more precise. The coastline with erosion values was the basis for generating buffers around the segments corresponding to the predicted intensity of erosion. Twelve scenarios were considered: a combination of two time periods (2050, 2100), two emission scenarios (RCP4.5 and RCP8.5), and three percentiles of the uncertainty distribution of the projections (5<sup>th</sup>, 50<sup>th</sup>, and 95<sup>th</sup>).

However, the erosion projections assume an unlimited backshore space for shoreline retreat. This is not realistic as erosion could be slowed or stopped due to barriers such as hard protection structures, build-up areas, or geological features. Therefore, the projections were further constrained the erosion by introducing two types of barriers into the analysis. First, artificial surfaces representing various anthropogenic structures were extracted from the *Imperviousness Density 2015* dataset with a 100 m resolution<sup>14</sup>. Second, topographic barriers representing high ground that are unlikely to be easily eroded were obtained from a pan-European elevation model EU-DEM<sup>15</sup>. Areas with an elevation of 10 m above sea level and more were considered as barriers. The segmented coastline was used to generate transects of variable density at 50 m apart on average. Each transect was intersected with the barriers, erasing areas that are invulnerable to erosion. Parts of the transects that were no longer connected directly to the coastline were removed. The remaining parts of the transects were used to clip the erosion buffers to generate the final erosion layers under the 12 scenarios. Through intersection with the CLC 2018 layer, the loss in land and ecosystem services was obtained.

To analyse impacts at national and regional scales, the value of services lost is presented not only in absolute terms or relative to their value in 2018, but also in relative economic terms. For this purpose, GDP data in purchasing power parities from Eurostat<sup>13</sup> at both the national (2018) and regional (NUTS 3) levels were used (2018 or latest available, adjusted to 2018 price level). Two regions of Ireland (Mid-West and South-West) were merged for this analysis due to the lack of separate regional GDP estimates.

### *Limitations and uncertainties*

The study has focused on the negative effects of one process – coastal erosion. Notwithstanding the uncertainties and limitations of the datasets involved (land cover, erosion projections, ecosystem service valuation, and artificial and topographic barriers to erosion), which are discussed below, ecosystem services could decrease (or increase) due to factors that were not analysed in this study. For instance, coastal erosion could be compensated in some locations with land accretion. However, it is difficult to assess what ecosystem would develop and in what timeframe. The destruction of habitats could also have indirect effects. Salt marshes, the second-most affected land cover type according to this study, are particularly well-known for wave attenuation and their role in reducing erosion and flooding.

Further, ecosystems could be lost through episodic or permanent flooding of land that could occur due to mean SLR, increase in extreme sea levels, or the aforementioned loss of protective habitats. Coastal erosion could open new areas to inundations; for example, a coastal lagoon could be exposed by the loss of a lido, changing the lagoon's characteristics, and losing some of its ecosystem services. Other habitats could also be negatively affected by saltwater intrusions. There is also the possibility of habitat migration. In particular, coastal wetlands are expected to migrate landwards in response to SLR. However, this could happen only if there is enough accommodation space. Europe's coasts are heavily built-up and densely populated with many managed land-use types (especially urban and agricultural); hence, space for habitat migration is limited. Finally, the effect of the destruction of coastal ecosystems is assumed to be linear (proportional to the area lost), but this might not be the case because of the complexity of natural environment.

In the future, ecosystem service value could increase or decrease through changes in land cover and use caused by human activities, especially the expansion of urban, industrial, and infrastructure-related land. Mitigation action could prevent many of the losses indicated in the study but are not considered beyond their past influence on coastal erosion intensity. At the same time, coastal erosion mitigation is not always compatible with protecting ecosystem services. Conventional hard measures, which are short-lived and expensive, alter the coastal environment. This brief list of potential additional effects on coastal ecosystems highlights the complexity of the topic.

The datasets used in the study generally have the best available resolution. However, the minimum size of features in CLC is often too low to capture important aspects of the coastal zones, especially beaches, as they are often less than 100 m in width. Still, the uncertainty in the projections of coastal erosion is more important. It is challenging on a continental scale and implies some limitations due to the lack of data, predictive tools, and the availability of computational resources. Most significantly, the dataset used here<sup>2</sup> is limited to coasts with sandy beaches. Further, an important component of the projections is ambient shoreline trends that were obtained by extrapolating historical trends to the future. However, this assumes that the processes that introduce, displace, and remove sediment along the coast will not change in the future. Furthermore, the resolution of the remote sensing data (30 m) may be too coarse for parts of the European coastline.

The erosion projections also partially use the Bruun rule to estimate shoreline retreat due to SLR, which is not always optimal for this kind of analysis. As there is no European dataset of sandy beach width, the baseline projections assume unlimited backshore space for shoreline retreat. Due to limited data on coastal barriers, two proxies are introduced here: artificial barriers based on soil sealing data and topographic barriers based on the elevation data. The exact interaction of the coastline with these barriers is uncertain, but it still provides an improvement in terms of constraining erosion to areas where it is most likely to occur.

Finally, there is uncertainty in the economic analysis. Ecosystem services have a specific value and are measurable, but there is great diversity in methods used to estimate their actual value. Different studies used various approaches deviating from the “willingness to pay” concept utilised in the estimates applied here, such as market prices, replacement costs, production costs, travel costs or opinion polls. Detailed methods and discussion can be found in a paper by Paprotny et al.<sup>16</sup>.

# GLOSSARY

**Comparative advantage.** When an individual, firm or nation is able to produce a particular product at a lower opportunity cost than another individual, firm or nation. Forms the basis on which countries trade with one another.

**Economic growth.** An increase in the output of goods and services in a country between two periods.

**Factor cost.** A measure of output reflecting the costs of the factors of production used, rather than market prices, which may differ because of indirect tax and subsidies (see GDP).

**Factors of production.** The ingredients of economic activity / the human and natural resources needed to produce any good or service: land, labour, capital and enterprise.

**Gross domestic product (GDP).** The total market value of all final goods and services produced during a given time period within a country's borders. Equal to the total income of the nation's households or the total expenditures on the nation's output.

**Gross operating surplus.** The surplus generated by operating activities after the labour factor input has been recompensed. It can be calculated from the value added at factor cost less the personnel costs. It is the balance available to the unit, which allows it to compensate the providers of own funds and debt, to pay taxes, and eventually finance all or a part of the investment.

**Gross investment in tangible goods.** Investment during the reference period in all tangible goods. Included are new and existing tangible capital goods, whether bought from third parties or produced for own use (i.e. Capitalised production of tangible capital goods), having a useful life of more than one year including non-produced tangible goods such as land. Investments in intangible and financial assets are excluded.

**Number of persons employed.** Total number of persons who work in the observation unit (inclusive of working proprietors, partners working regularly in the unit and unpaid family workers), as well as persons who work outside the unit who belong to it and are paid by it (e.g. sales representatives, delivery personnel, repair and maintenance teams).

**Nominal value.** The value of anything expressed simply in the money of the day. Since inflation means that money can lose its value over time, figures in real value adjust the nominal figures to remove the inflationary distortions.

**Personnel costs.** The total remuneration, in cash or in kind, payable by an employer to an employee (regular and temporary employees as well as home workers) in return for work done by the latter during the reference period. Personnel costs also include taxes and employees' social security contributions retained by the unit as well as the employer's compulsory and voluntary social contributions. Personnel costs are made up of wages, salaries, and employers' social security costs.

**Sustainability.** The ability to endure over time. Sustainable growth requires that resources be used at a rate at which they are able to replenish and that the environment is not spoiled in during the production process.

**Tangible assets.** Assets one can touch: buildings, machinery, gold, works of art, etc. Contrast with intangible assets.

**Turnover.** The total invoiced by the observation unit during the reference period, and this corresponds to market sales of goods or services supplied to third parties; it includes all duties and taxes on the goods or services invoiced by the unit with the exception of VAT, invoiced by the unit to its customer and other similar deductible taxes directly linked to turnover; it also includes all other charges (transport, packaging, etc.) passed on to the customer.

**Value added at factor costs (GVA).** The gross income from operating activities after adjusting to operating subsidies and indirect taxes. Value added at factor costs is calculated 'gross' as value adjustments (such as depreciation and impairment losses) are not subtracted. GVA can be calculated from turnover, plus capitalised production, plus other operating income (including operating subsidies), plus or minus the changes in stocks, minus the purchases of goods and services, minus other taxes on products which are linked to turnover but not deductible, minus the duties and taxes linked to production. Alternatively, GVA can be calculated from gross operating surplus by adding personnel costs.
